PENGER- JA LEIKKAUSMASSOJEN
LASKEMISTA VARTEN.

HELSINKI 1932.
VALTIONEUVOSTON KIRJAPAINO

Niiden teknillisten ohjeiden lisäksi, mitkä valtioneuvosto on toukokuun 15 päivänä 1930 tekemällään päätöksellä antanut teiden rakentamisesta ja kunnossapidosta, tie- ja vesirakennushallitus on mainitussa valtioneuvoston päätöksessä olevan määräyksen mukaisesti tänään tapahtuneessa esittelyssä vahvistanut ohelliset normaalipiirustukset erilaatuisten teiden rakentamisesta.

Helsingissä, tie- ja vesirakennushallituksessa, toukokuun 13 päivänä 1931.

E. W. Skogström.

E. J. Lehto.

Teiden normaalipiirustusten merkitsemistavat.

1:o Tien luokka.

Teiden tekemistä koskevassa valtioneuvoston päätöksessä toukokuun 15 päivältä 1930 mainittu tien luokka merkitään latinalaissella järjestysluvulla I—IV. Polkuteiden (V luokan teiden) rakentamista varten ei normaalipiirustuksia ole laadittu.

2:o Tien tyyppi.

Samaan tieluokkaan saattaa kuulua teitä, jotka eroavat toisistaan leveytensä sekä rakenteensa puolesta. Tämä tyyppi eroavaisuus merkitään tien luokkaa osoittavan järjestysluvun jälkeen asetettavalla pienellä aakkosella.

3:o Tien ajoradan rakennustapa.

Samaan luokkaan ja tyyppiin luettavien teiden päälysrakenne tehdään silmälläpitäen liikenteen suuruutta, raskautta y. m. seikkoja. Ajoradan rakennustapa merkitään luokka- ja tyyppimerkinnän jälkeen asetettavalla arabialaisella järjestysluvulla.

4:o Tien alusrakenteen rakennustapa.

Alusrakenteen rakennustapa, joka kussakin tieluokassa ja -tyypissä on riippuvainen maanlaadusta, merkitään samaten kuin ajoradankin rakennustapa arabialaisella järjestysluvulla siten, että ajoradan ja alusrakenteen rakennustapaa osoittavat luvut muodostavat murtoluvun, edellisen ollessa osoittajana ja jälkimäisen nimittäjänä.

Esim. merkintä II b 2/5 tarkoittaa II luokan kevytrakenteista (b) maantietä, jonka ajoradan kantava kerros on someroa (2) ja jonka alusrakenne on suunniteltu savimaata (/5) silmälläpitäen.

Tie- ja vesirakennushallituksen laatimat normaalipiirustukset käsittävät seuraavat luokkansa, tyyppinsä, ajoratansa ja alusrakenteensa puolesta toisistaan eroavat tiemuodot:

Merkintä	Tien-pinnan leveys m	A j o r a d a n			Alusrakenne
		leveys m	kantava kerros	päälyste	
I a 1/1—10	8.00	6.00	—	Kenttäkiveys sora-alustalla	1—10 jälempänä olevan maah-laatuluettelon mukaan
I a 2/1—10	»	»	—	Nupukiveys sora-alustalla	»

III b /1—10	3.60	3.60	—	Sora	»
IV /1—10	2.50	2.50	—	Sora	»

Kunkin piirustusarkin vasempaan yläkulmaan on merkitty, mitä tiemuotoja koskevia piirustuksia arkki sisältää.

Tien alusrakenne tehdään maanlaadusta riippuen noudattamalla seuraavia, 1—10 merkityjä rakennustapoja:

Rakennustapa	M a a n l a a t u
1	Kova, savensekainen hiekka.
2	Sora tai savensekainen sora.
3	Hieno kangashietä.
4	Tavallinen hiekka.
5	Savi.
6	Kuohusavi.
7	Kovapohjainen turvesuo.
8	Mutasuo.
9	Kallio, leikkauksen syvyys enintään 1.00 m.
10	» » » yli 1.00 m.

Tietutkimusten toimittamisesta ja suunnitelmien laatimisesta.

I. Tutkimukset.

a) Alustavat toimenpiteet sopivan tiesuunnan selvillesaamiseksi.

Ennen varsinaisen koneellisen tutkimuksen aloittamista on mahdollisimman tarkkaan otettava selville kaikki tien suuntaukseen vaikuttavat taloudelliset ja teknilliset tekijät, kuten asianomaisten seutujen asutusolot ja liikennetarpeet ja niitten vastainen kehitys, kauttakulkuliikenteen vaatimukset, tielle odotettavan liikenteen suuruus ja laatu, maaston soveltuvaus ja sen asetamat vaikeudet ja esteet j. n. e. Kun näihin seikkoihin on tutustuttu saatavissa olevien tilastotietojen ja karttojen, paikalla toimitettavien silmämääräisten tutkimusten ja kokousten y. m. avulla, on tien suunta pääpiirteissään sekä ne kohdat, joiden kautta tie on maaston laadun takia tai muista syistä ehdottomasti ohjattava kulkemaan, määrättävä. Myöskin on ennen koneellisen tutkimustyön aloittamista määrättävä tien luokka ja tyyppi, jotta nämä seikat voitaisiin tutkimusten suorittamisen yhteydessä ottaa huomioon.

b) Tielinjan seivästys.

Kun edellämainitut seikat on selvitetty, ryhdytään tielinjan seivästykseen. Tällöin on tiesuunta ennakolta määrätyjen kauttakulkukohtien välillä koetettava teknillisä ja taloudellisia näkökohtia silmälläpitäen saada mahdollisimman suoraksi. Harikittaessa onko jokin luonnon- tai muu este kierrettävä tai lisäkustannuksista huolimatta raivattava pois tieltä, on vastaisten liikennöimis- ja kunnossapitokustannusten suuruudet, liikennöimisvarmuus y. m. asiaanvaikuttavat seikat tarkoin huomioon otettava. Myöskin on seivästys siten toimitettava, että tiehen tulevat kaarteet voidaan tehdä mahdollisimman suorisäteisiksi.

Mikäli asianomaiset maanomistajat eivät anna lupaa tutkimustyön suorittamiseen tiluksillaan, on tässä suhteessa meneteltävä siten kuin voimassaolevan pakkolunastuslain VI luvussa säädetään.

Linjan seivästyksessä ja tutkimustyössä yleensä on välttetävä tarpeetonta metsän haaskausta y. m. vahingontuottamista.

c) Mittaus ja paalutus.

Kun tielinjan seivästys on suoritettu ja tarkistettu, paalutetaan kaarteet maastoon ja merkitään sekä tielinjan taitekohdat että kaarteitten tangenttipisteet asianmukaisilla kulma- ja pituusmerkinnöillä varustetuilla paaluilla.

Mittaus toimitetaan täten maastoon merkityä tielinjan keskiiviavaa pitkin. Mittapaalut lyödään joka 20 metrin päähän (III b ja IV luokan teillä vaihtoehtoisesti 50 metrin päähän) ja numeroidaan siten, että joka 100 metrin päässä elevat paalut muodostavat varsinaisen peruspaalutuksen (piir. 3 ja 4). Peruspaalut numeroidaan juoksevalla numeroilla o-paalutusta alkaen ja välipaalut edellisen peruspaalun numerolla ja etäisyysmerkinnällä tältä paalusta. Esim. merkintä 12 + 60 tarkoittaa välipaalua, jonka etäisyys peruspaalusta N:o 12 on 60 metriä.

Peruspaalujen numerot sekä linjan kulmapaalujen merkinnät ovat tehtävät kaivertamalla.

d) Vaakitus.

Tielinjan pituusleikkausta vaakittaessa on määrättävä maanpinnan korkeus kaikkien perus- ja välipaalujen kohdalla, sekä tarpeen vaatiessa näitten paalujen välläkin, etenkin maanpinnan taitekohdissa y. m., niin että vaakituksen perusteella tielinjan pituusleikkaus voidaan oikein ja tarpeellisella tarkkuudella piirtää. Tärkeiden tietutkimusten ollessa kysymyksessä on virheiden välttämiseksi pituusvaakitus toimitettava kahteen kertaan tai samanaikaisesti kahdella vaakituskoneella.

Missä maapinta poikkisuunnassa on epätasaista tai kaltevampaa kuin 1: 10, tai milloin muusta syystä joko massojen laskemista tai muuta tarkoitusta varten on tarpeellista, toimitetaan asianomaisissa paikoissa tarpeellisella tarkkuudella poikkileikkausvaakitusia.

Milloin vesistöjä sattuu tielinjalle tai sen välittömään läheisyyteen, on erikoista huomiota kiinnitettävä tulva- ja matalavesipintojen korkeuksien oikeaan määräämiseen.

Kiintopisteitä on merkittävä kallioon tai liikkumattomiin maakiviin sopivan matkan päähän tielinjan sivuun ainakin yksi kutakin kahta tiekilometriä kohti. Kiintopiste merkitään esim. 10—12 cm:n läpimittaisella, noin 1 cm:n syvyiseksi hakattavalla ympyrällä, kirjaimilla K. P. sekä järjestysnumerolla.

Mikäli mahdollista, on vaakitus liitetävä Suomen tarkkavaakitukseen ja korkeudet verrattava tarkkavaakituksen NN-tasoon. Milloin tämä ei käy päinsä, on vertaustason korkeus määrättävä sellaiseksi, että kaikki suunnitelmassa esiintyvät korkeusluvut tulevat positiivisiksi.

e) *Kartoitus.*

Tielinjasta sekä sen ympäristöstä 100—200 metrin etäisyyteen linjan molemmin puolin on laadittava kartta, johon paitsi tielinjaan paaluineen ja kiintopisteineen on merkittävä valtakunnan, läänien, kihlakuntien, pitäjien, tilusten, tonttien y. m. rajat, vesistöt, viljelykset, metsät, suot, kalliot y. m. maastoeroavaisuudet, maan-, kunnan-, kylä-, tilus- y. m. tiet ja polut, rautatiet, asuin-, ulkohuone- y. m. rakennukset, tulevan tiealueen rajat, sähkö-, lennätin-, puhelin- y. m. johdot j. n. e.

I a—d, II a—c ja III a luokan teiden kartat laaditaan tarpeen mukaan mittakaavaan 1:1000, 1:2000 tai 1:4000, III b ja IV luokan teiden kartat mittakaavaan 1:2000, 1:4000 tai 1:8000.

Siltapaikkojen y. m. erikoiskartat laaditaan sopivan mittakaavaan.

Tietä varten lunastettavat soran y. m. tientekoaineiden ottopaikat ympäristöineen kartoitetaan mittakaavaan 1:1000.

Kaikkiin karttoihin on merkittävä pohjoista ilmansuuntaa osoittava nuoli.

f) *Maaperätutkimukset.*

Koska tien rakennustapa sekä leikkaus- ja pengerrystöiden kustannusten oikea arvioiminen riippuu kokonaan maaperän laadusta, ovat maaperätutkimukset suoritettavat erikoisen huo- lillisesti. Maaperän laatu on otettava selville kaikkialla ja jo tutkimuksen yhteydessä määritävä, mitä rakennustapaa käyttäen missäkin tien alusrakenne on tehtävä.

Missä maaperä on niin pehmeätä, että sen takia on ryhdyttävä erikoisiin toimenpiteisiin tiepohjan vahvistamiseksi tai missä penkereen painumista on odottavissa, kuten esim. soiden, rämeiden, vesistöjen y. m. kohdalla, tahi milloin leikkaustöitä tulee suoritettavaksi, on maaperän laatu tarpeelliseen syvyyteen saakka tutkittava maaporauksien avulla.

g) *Muita tutkimuksen yhteydessä varteenotettavia seikkoja.*

Sen lisäksi, mitä edellä on mainittu, on tutkimuksen toimittajan tutkimuspaikalla otettava selkoa maa-alueitten omistussuhteista, soran, savisoran, sidemaan, rakennus- y. m. kivien, eristysaineitten y. m. tientekotarpeitten saantimahdollisuksista ja hinnosta, työpalkoista, työntekijäin majoittamismahdollisuksista y. m. suunnitelman ja kustannusarvion laatimisen yhteydessä huomionottavista seikoista.

Silta- y. m. taitotöitä varten suoritettavissa tutkimuksissa on noudata tettava niistä annettuja erikoismääräyksiä.

II. Suunnitelman laatiminen.

a) Suunnitelma sisältää:

- 1) Yleiskartan mittakaavassa 1 : 400 000 (piir. 2), johon rakennettava tie on selvästi merkittävä,
- 2) kartan tiesuunnasta ja sen lähiympäristöstä sellaisessa mittakaavassa kuin edellä kartoitustöiden yhteydessä on mainittu (piir. 3 ja 4),
- 3) pituusleikkauspiirustuksen, jonka pituuskaava on sama kuin kohdassa 2) mainitun kartan, ja korkeuskaava 10 kertaa suurempi kuin pituuskaava (piir. 3 ja 4),
- 4) poikkileikkauspiirustukset tarpeellisista kohdista mittakaavassa 1 : 25, 1 : 50 tai 1 : 100,
- 5) erikoispiorustukset rummuista, silloista, lossilaitureista, penkkereistä, kaiteista j. n. e. sekä, milloin siltasuunnitelmaa ei piirissä laadita, siltatutkimuspiirustukset ja selostukset,
- 6) litteroimistaulukon mukaisen kustannusarvion, sekä
- 7) lausunnon, jossa m. m. on mainittava, millä perusteilla tiesuunta ja tien tyyppi ovat määritetyt, mistä ja millä hinnoilla rakennusaineita on saatavissa, kuinka suuria työpalkkoja paikka-kunnalla maksetaan, j. n. e.

b) Tiettyypin valinta.

Sopivan tiettyypin valitseminen on tärkeimpiä tehtäviä uutta tietä suunniteltaessa, ja tämän takia on valitseminen toimitettava huolellisesti ja huomioonottaa kaikki asiaan vaikuttavat tekijät. Tällaisista voidaan mainita tielle odotettavan liikenteen vilkkaus, raskaus ja laatu, rakentamis- ja vastaiset kunnossapitokustannukset, liikennöimiskustannukset, liikenneturvallisuus ja -mukavuus, terveydelliset näkökohdat, rakennusaineitten saantimahdollisuudet j. n. e.

Luonnollista on, ettei normaalipiirustuksiin voida sisällyttää kaikkiin mahdollisiin olosuhteisiin ilman muuta soveltuvia erilaisia tiettyypejä, minkä vuoksi asiallisesti perusteltu poikkeaminen tie- ja vesirakennushallituksen normaalipiirustuksista on sallittua. Täten voidaan esim. eri tiettyypejä yhdistelemällä saada useita uusia tiemuotoja. Myöskin on sellaisissa tapauksissa, jolloin maanlunastuskustannusten suuruus tai muut seikat eivät ole esteenä, alempiluokkaisten teiden sivuojat suunniteltava kaivetavaksi niin etäälle toisistaan, ettei tien muuttaminen vastaisuudessa korkeampiluokkaiseksi tuota tässä suhteessa vaikeuksia.

c) *Tasaus.*

Kun tietyön yhteydessä suoritettavien leikkaus- ja pengerrystöiden suuruus ja siis myöskin kustannukset ovat kokonaan riippuvaisia tien tasausksesta, on se toimitettava erittäin huolellisesti. Niinpä on tasausta suunniteltaessa koetettava supistaa leikkaus- ja pengerrystöt sekä massojen siirrot mahdollisimman vähäisiksi. Kuitenkin on aivan lyhyttaitteista tasausta sekä n. s. hukkanousuja varsinkin korkeampiluokkaisten teiden ollessa kysymyksessä vältettävä. Milloin taasen jostakin leikkausksesta saadaan edullisesti soraa, svisoraa, sidemaata, kiviä t. m. s. tienrunkoon ja ajorataan tarvittavia rakennusaineita, on syytä suunnitella leikkaus suuremmaksi kuin pelkästään varsinaisten leikkaus- ja pengerrystöiden kannalta olisi tarpeellista.

Kun tien alusrakenteen tekotapa vaihtelee maaperän laadun mukaan, riippuu tasausviivan korkeus n. s. nollatasauksessa huomattavasti paitsi tien luokasta, myöskin maaperän laadusta. Allaolevassa taulukossa on esitetty tasausviivan korkeus nollatasauksessa, huomionottaan, että sivuojista saatavaa massaa ei käytetä itse paikalla tienrungon alle, vaan heitetään sivulle tai kuljetetaan muualle pengertäytteeksi. (Suomaalla käytetään sivuojista saatava massa normaalipiirustusten mukaisesti tiepohjan tekoon).

Tasausviivan korkeus k nollatasauksessa:

Tietypetti	Maaperän laatu normaalipiirustusten mukaan								
	1	2	3	4	5	6	7	8	9-10
I c	0.38	0.22	0.64	0.55	0.85	0.95	0.80	0.80	0.30
I d	0.25	0.13	0.54	0.44	0.65	0.83	0.75	0.75	0.29
II a	0.33	0.19	0.57	0.47	0.67	0.82	0.65	0.65	0.28
II b	0.23	0.09	0.41	0.34	0.54	0.64	0.55	0.55	0.27
II c	0.19	0.09	0.37	0.29	0.50	0.60	0.50	0.50	0.27
III a	0.17	0.07	0.35	0.27	0.42	0.51	0.50	0.50	0.22
III b	0.01	0.01	0.20	0.20	0.37	0.45	0.40	0.40	0.21
IV	0.01	0.01	0.20	0.20	0.30	0.40	0.34	0.34	0.19

Tasausviivan pystysuorat taitteet ovat pyöristettävät tasoituskäyillä. Tasoituskäyrän tangentin pituus saadaan kaavasta:

$$X = \frac{1}{2} R (S_1 \pm S_2),$$

jossa X = tangentin pituus metreissä, S_1 ja S_2 = noususuhteiden suuruudet, sekä R = tasoituskäyrän säde metreissä.

Tasoituskäyrän ordinaatta Y saadaan kaavasta:

$$Y = \frac{X^2}{2R}$$

Allaolevassa taulukossa on esitetty tasoituskäyrän ordinaattojen pituudet eri sääteille:

X m	Pystysuoran tasoituskäyrän ordinaatit.				X m	Pystysnoran tasoituskäyrän ordinaatit.			
	S = 1 000	S = 700	S = 500	S = 350		S = 1 000	S = 700	S = 500	S = 350
0	0.00	0.00	0.00	0.00	26	0.34	0.48	0.68	0.97

25	0.31	0.44	0.63	0.89					

d) Massojen laskeminen.

Ohellisia taulukoita voidaan pengeri- ja leikkauuspinta-alojen määräämiseen käyttää milloin maanpinta ei poikkituunnassa ole erikoisen epätasaista eikä sen sivukaltevuus ole suurempi kuin 1 : 10. Muissa tapauksissa ovat pinta-alat määritettävät poikileikkauspiirustusten avulla.

Pengertaulukoihin on merkitty vain varsinaisen täyttemaan pinta-alat, joten penkkereen kohdalla olevista ojista saatava massa määräitään erikseen.

Pengermassoja laskettaessa on huomattava, että määritystä tasausviivan rajakorkeuksista ylöspäin pengertäytteenä voidaan käyttää erilaisia maalajeja, ja että siis tasausviivan korkeuden kasvaessa näitä raja-arvoja suuremmaksi tien rakenne ja pengertäytteen poikkileikkauuspinta-ala ovat riippuvaisia käytetyn pengertäytteen laadusta. Näitä rajakorkeuksia vastaavaan kohtaan on sarekkeisiin merkitty sulkumerkkien välillä numero, joka osoittaa, minkä laatuista täyttemataa tästä tasausviivan rajakorkeudesta ylöspäin myöskin voidaan pengertäytteenä käyttää, ja

mistä taulukon sarekkeesta tällöin pengertäytteen poikkileikkaus-pinta-ala saadaan.

Esim. jos tasausviivan korkeus I c 2/1—10 luokan tiellä, maa-perän ollessa soraa tai savensekaista soraa (2), on = 0.60 m, voidaan pengertäytteenä käyttää, paitsi soraa tai savensekaista soraa (2), myöskin savensekaista hiekkaa (1) tai tavallista hiekkaa (4), edellyttäen tietenkin, että tien alusrakenne tehdään näiden maalaatujen edellyttämällä tavalla. Pengertäytteen poikkileikkauspinta-alat ja tien rakennustavat ovat näissä eri tapauksissa seuraavat:

Pengertäytteenä on:	Pinta-ala m^2	Tien rakennus-tapa:
Soraa tai savensekaista soraa (2)	2.95	I c 2/2
Savensekaista hiekkaa (1)	1.84	I c 2/1
Tavallista hiekkaa (4)	0.41	I c 2/4

Leikkaustaulukoista saadaan koko leikkauspinta-ala. Mikäli niskaojat ehdotetaan kaivettaviksi, on niistä saatava massa kuitenkin laskettava erikseen.

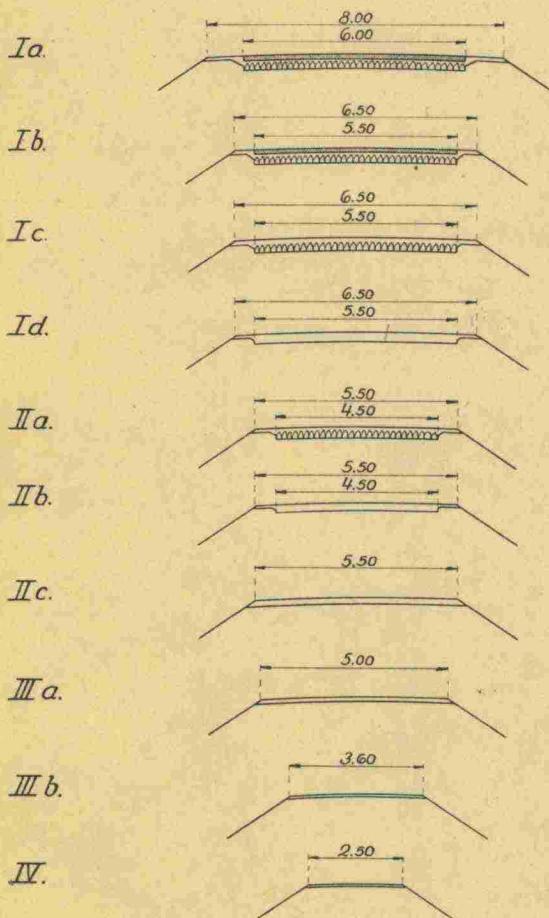

Taulukkoihin on merkitty pengerten ja leikkausten teoreettiset pinta-alat, joten niiden avulla saataviin pengermassoihin on painumisen, maanpinnan epätasaisuuden y. m. seikkojen varalle lisättävä 20 % ja leikkausmassoihin 15 %.

Edelläolevia, uusien teiden tutkimista ja suunnittelemistä koskevia ohjeita on soveltuvin kohdin noudatettava myöskin tien-parannustöitä varten tarpeellisten tutkimusten suorittamisessa ja tällaisten töiden suunnittelussa.

TEIDEN NORMAALIPIIRUSTUKSET.

1.

Teiden jako eri luokkiin ja tyypeihin.

Suunnitelman

2.
Piirustuksen korkeus tar-
peen mukaan 35 tai 50 cm.

Helsingin - Porvoon

välisen uuden maantien rakentamissuunnitelma.

(Helsingin, Sipoon ja Porvoon pitäjissä.)

Tien luokka ja tyyppi.	Ic
Tien pituus.	37,17 km.
Tiepinnan leveys.	6,50 m.
Ajoradan leveys.	5,50 m.
Jyrkin nousu.	0,050
Pienin kaarresäde.	300 m.

Yleiskartta 1:400000

Pituusleikkaus ja kartta 1:4000

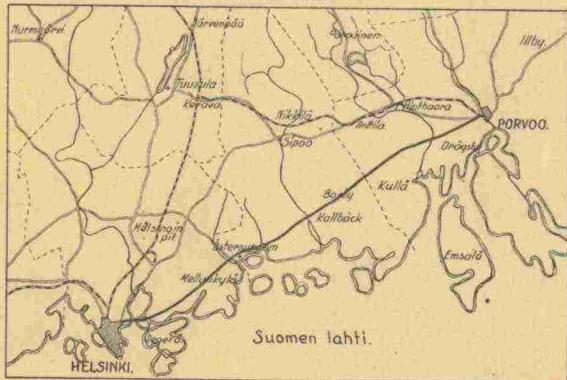

Pituusleikkaus. (korkeuskaava) 1:400

Polkkileikkaukset. 1:100

Erikoispiirustukset. 1:50

Yleiskartta

1:400000

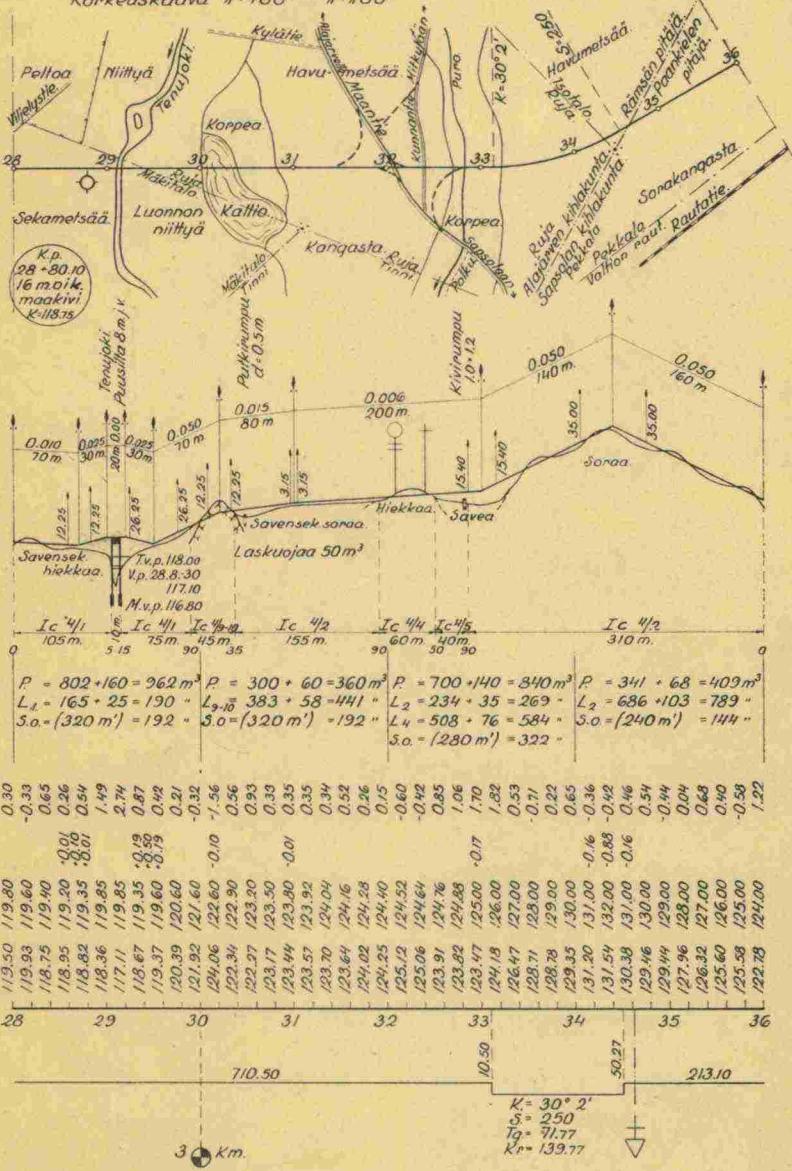

Ia-d, IIa-c, IIIa luokan tiet.

3.

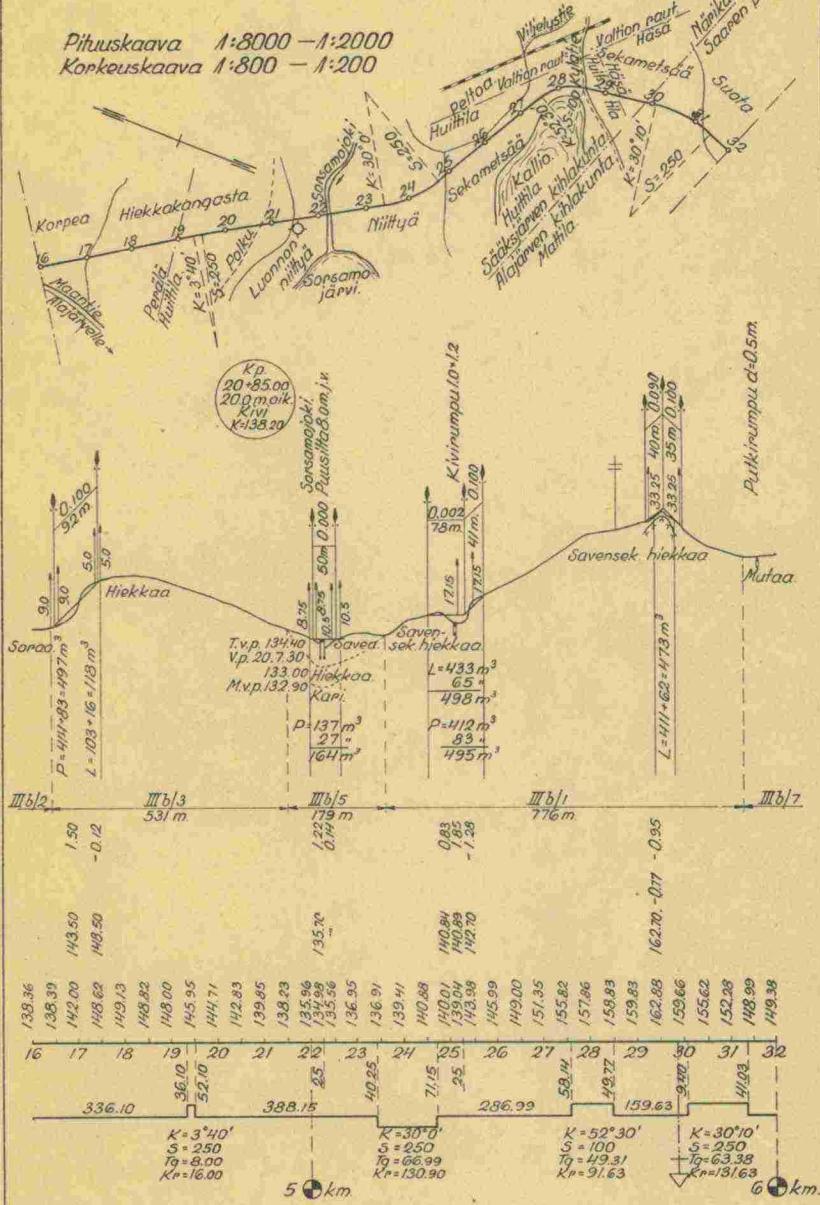

Pituuskaava 1:4000—1:1000
Korkeuskaava 1:400—1:100

Piirustuksen korkeus tappaan 35 tai 50 cm.

IIIb-IV luokan tiet.

Pituuskaava 1:8000 - 1:2000
Korkeuskaava 1:800 - 1:200

5.
