Foreword

The Finnish Rail Administration (RHK) publishes this Network Statement for the timetable period 2010. This is the seventh Network Statement prepared in Finland, in accordance with the Finnish Railway Act. The Network Statement describes the access conditions, the state-owned rail network, the allocation capacity, the services supplied to railway undertakings and the principles of determining the infrastructure charge. The Network Statement is published for applicants for capacity for each timetable period separately. The present Network Statement is intended for the timetable period 13.12.2009–11.12.2010.

The Network Statement 2010 has been prepared based on the previous Network Statement taking into account the feedback received from users and the Network Statements of other European Infrastructure Managers.

The structure of the Network Statement follows the common European structure and comprises the following chapters:

- 1 General
- 2 Access conditions
- 3 Rail network
- 4 Capacity allocation
- 5 Services supplied to railway undertakings
- 6 Infrastructure charge

During timetable period 2010 the Finnish Rail Administration, Finnish Road Administration and part of the Finnish Maritime Administration will probably be united to form the Transport Infrastructure Agency. The research and foundation work of the new office are not finished at the time of publishing the Network Statement, and the changes they cause, for example, to different practices cannot be anticipated. Updates will be published on the Network Statement 2010 website, address <http://www.rhk.fi>.

Also the Finnish Rail Agency, Finnish Vehicle Administration, Finnish Civil Aviation Authority and part of the Finnish Maritime Administration will probably be united, and become the Transport Security and Safety Agency in timetable period 2010. The establishment of this new agency will also affect the regulations, instructions and links to information sites mentioned in the Network Statement 2010. These updates can also be found on the Network Statement 2010 website at the above-mentioned address.

In the Network Statement 2010 the names Finnish Rail Administration and Finnish Rail Agency are used, because the establishment, tasks or names of the new agencies have not been confirmed yet.

Within the Finnish Rail Administration, the Network Statement is the responsibility of the Traffic Management Unit. All the departments of the Finnish Rail Administration and several outside specialists have been involved in the preparation of the Network Statement.

1 General Information

1.1 Introduction

The Network Statement is published in accordance with the Railway Act (555/2006) and Directive 2001/14/EC of the European Parliament and of the Council on the allocation of railway infrastructure capacity and the levying of charges for the use of railway infrastructure and safety certification (hereinafter referred to as the "Capacity and Infrastructure Charge Directive"). The Network Statement for the timetable period 2010 is the seventh Network Statement published in Finland.

1.2 Objective

The Network Statement is published for the use of applicants for capacity for each timetable period separately. The Network Statement describes the access conditions, state-owned rail network, capacity allocation, services supplied to railway undertakings and the basis on which the infrastructure charge is determined. The Network Statement specifies in detail the general rules, deadlines, procedures and grounds applicable to capacity allocation and the charging systems.

Railway undertakings can request capacity for international traffic within the European Economic Area, as well as for domestic freight traffic. Domestic passenger traffic and transit traffic to Russia on the Finnish rail network may be operated only by VR Ltd.

1.3 Legal Framework

Current Legislation

In accordance with the Railway Act, RHK publishes information on the provisions of the Railway Act, as well as on the provisions issued under this Act and other provisions, concerning

- 1) the right of access to the rail network
- 2) the principles of determining the infrastructure charges
- 3) applying for rail capacity and the related deadlines
- 4) the requirements for and approval of railway rolling stock as well as
- 5) other conditions concerning operating and starting the operation of rail traffic.

RHK publishes information on the nature and extent of the rail network in the Network Statement for each timetable period. This information is contained in Chapter 3 of this Network Statement. The provisions issued by RHK on:

- 1) specialised infrastructure under the Railway Act (point 3.4.1)
- 2) the priority order to be applied to congested infrastructure under the Railway Act (point 4.4.3)
- 3) the threshold quota for the minimum use of railway infrastructure on each train path under the Railway Act (point 4.6) are also published in the Network Statement.

1.4 Legal Status

1.4.1 General Remarks

The Network Statement is not a regulation issued by RHK but a document providing information.

1.4.2 Liability

Information published in the Network Statement does not affect regulations issued by RHK or the Finnish Rail Agency. Information on the third parties mentioned in the Network Statement may also change during the timetable period.

1.4.3 Appeals Procedure

A decision taken by RHK may be appealed against under the Railway Act by filing a claim for rectification with the Regulatory Body, which in Finland is Finnish Rail Agency. A claim for rectification may be filed if the decision taken by the Regulatory Body concerns:

- 1) priority order for allocating capacity in individual cases
- 2) levying of the infrastructure charge
- 3) capacity allocation
- 4) allocation of urgently needed capacity
- 5) issuance of a safety certificate or
- 6) the access contract.

The claim for rectification shall be filed with the Finnish Rail Agency within 30 days of the date of receipt of notice of the decision. The Finnish Rail Agency shall decide on the claim for rectification within two months of the date on which all relevant information for taking a decision has been delivered to it. The decision shall, however, be taken within ten days of the date on which all relevant information has been delivered if the claim concerns the priority order in individual cases, capacity allocation or a request for urgently needed capacity.

1.5 Structure of the Network Statement

This Network Statement follows the common structure set for Network Statements by RailNetEurope.

The Network Statement consists of five more chapters in addition to this one. The second chapter deals with the requirements for accessing the Rail Network, the third handles the rail network infrastructure, the fourth covers issues related to capacity allocation, the fifth chapter is about services offered to railway undertakings, and the sixth chapter deals with the infrastructure charge and charging principles. The Network Statement includes appendices that provide a more detailed description of the rail network features and other issues related to rail traffic operations.

1.6 Validity and Updating

1.6.1 Validity Period

The Network Statement is valid for one timetable period. It is published four months ahead of the expiry of the deadline for submission of capacity requests, that is 12 months ahead of the timetable period. The Network Statement 2010 is intended for the timetable period 2010, that is, for the period 13.12.2009–11.12.2010. The Network Statement for the timetable period 2011 will be published by 11.12.2009 at the latest.

1.6.2 Updating Process

If information contained in item 1.3 changes, RHK will publish the changes in its publications.

The Appendix 11 of the Network Statement presents an estimate of the railway work that is to be done during the timetable period 2010 and which may affect traffic. The working programme, timing of tasks and the required railway work will change as the funding and plans become more focused. The Finnish Rail Administration will publish the list of railway work and maintain an updated version of the document on its website at <http://www.rhk.fi>.

The agency changes mentioned in the preface may cause updates to the Network Statement and the Appendices after the printed version has been published. Updates will be published on RHK's publications and Network Statement website.

1.7 Publishing

The Network Statement is published in three languages: Finnish, Swedish and English. If any discrepancies are found between the different language versions, the Finnish language version will prevail. The Finnish version of the Network Statement can be obtained in printed form from the Finnish Rail Administration and all language versions are available in PDF format on the Finnish Rail Administration's website at <http://www.rhk.fi>.

Development plans for the rail network for 2010–2013 are presented in RHK's action plan (TTS). Statistics concerning the rail network and railway traffic are presented in the annually published Finnish Railway Statistics.

1.8 Contacts

Finnish Rail Administration

The Finnish Rail Administration, Finnish Road Administration and part of the Finnish Maritime Administration will probably be united at the beginning of 2010 to form the Transport Infrastructure Agency. The contact information and organisation of the new agency were not known at the time of printing the Network Statement. The information will be updated on the Network Statement 2010 website and the website of the new agency.

The Finnish Rail Administration is a department subject to the Ministry of Transport and Communications. It is responsible for the maintenance and development of Finland's rail network, railway capacity allocation and traffic control.

Finnish Rail Administration

**PO Box 185 (street address: Kaivokatu 8, 6th floor)
FI-00101 Helsinki**

Telephone: +358 20 751 5111

Fax. +358 20 751 5100

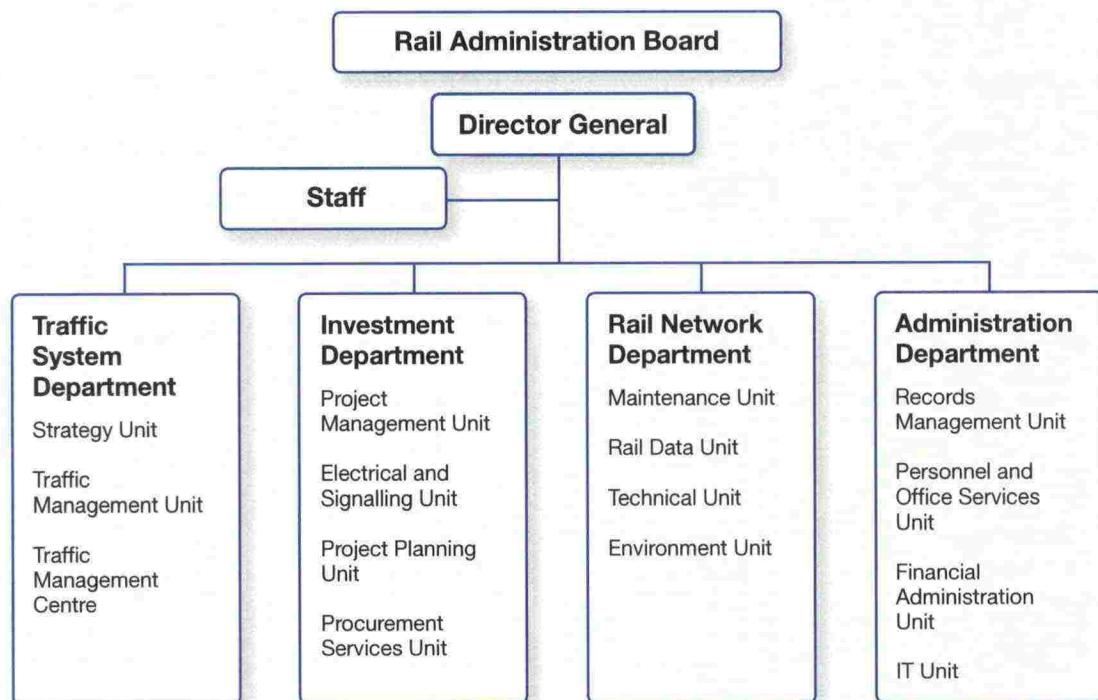

E-mail: info@rkh.fi, kirjaamo@rkh.fi

Internet: <http://www.rhk.fi>

On matters regarding entering the market or railway traffic, e-mail can be sent to rhkoss@rkh.fi.

Other contact information can be found on RHK's website.

RHK's organization

Finnish Rail Agency

The Finnish Rail Agency, Finnish Vehicle Administration, Finnish Civil Aviation Authority and part of the Finnish Maritime Administration will probably be united at the beginning of 2010 to form the Transport Safety and Security Agency. At the time of printing the Network Statement, the address and organisation of the new agency were not known. Further information can be found on the Network Statement 2010 website and the website of the new agency.

The Finnish Rail Agency is a department subject to the Ministry of Transport and Communications. It is responsible for monitoring general railway safety, the safety of railway systems and the safety of operations carried out by railway companies and rail network administrators.

1.9 RailNetEurope – International Co-operation between Infrastructure Managers

In January 2004, the European railway infrastructure managers established a common organisation to shape the business of European rail infrastructure. RailNetEurope or RNE is an organisation whose goal is to promote international traffic in the European railway infrastructure and sell and market the railway capacity managed by its members.

Instead of engaging in bilateral or multilateral co-operation, the European railway infrastructure managers established a single organisation, RNE, to represent all of its members from the European perspective. The goal is to harmonise regulations and promote European rail traffic, and in so doing benefit every member.

RNE consists of 33 members, either full or associated members or candidates. All in all RailNetEurope partners serve a network of around 230,000 km railway infrastructure. Also a ferry line has joined the association and contributes to lowering the barriers in international rail traffic. RNE's main target group consists of customers engaging in international business. The Infrastructure Managers involved in RailNetEurope today take care of 120 customers dealing with international business and over 300 companies involved in national rail traffic.

The RNE members have set up One Stop Shops (OSS) working as a network of customer contact points. For international path requests, the customer needs to contact only one of these OSS, which will coordinate the whole international path allocation process.

One Stop Shop:

- Offers the customer support and information on the full product and service range of the Infrastructure Managers.
- Supplies all the information required to gain access to the infrastructure of any Infrastructure Manager participating in RNE.
- Handles requests for any international train path within RNE.
- Ensures that requests for the next timetable period are duly taken into account in the annual timetabling process.
- Provides train path offers for the whole international journey.

Each OSS contact is part of the international network aiming at making network access for customers as simple as possible. The OSS also provides information on infrastructure charges and train movements including quality monitoring. The OSS provides competent and efficient assistance across all borders, based on transparent, confidential and non-discriminatory procedures. The contact information of railway infrastructure managers' OSS contacts can be found on the RailNet-Europe's website at <http://www.railneteurope.com>.

RailNetEurope members include:

- Administrador de Infraestructuras Ferroviarias (ADIF) (Spain)
- Banedanmark (Denmark)
- Banverket, Rail Traffic Administration (BV) (Sweden)
- BLS AG (BLS) (Switzerland)
- Ceské Dráhy, a.s. (CD) / SZCD (the Czech Republic)
- CFR Compagnie Nationale des Chemins de Fer Roumains (CFR) (Rumania)
- Communauté de Transports – Accès Réseau (Luxembourg)
- DB Netz AG (Germany)
- EDISY Traffic Directorate (EDISY) (Greece)
- Eurotunnel (France/England)
- Finnish Rail Administration (RHK) (Finland)
- Györ-Sopron-Ebenfurti Vasút Rt. / Raab-Oedenburg-Ebenfurter Eisenbahn AG (GYSEV/Raaberbahn) (Austria/Hungary)
- HZ Infrastructura d.o.o. (Croatia)
- Infrabel (Belgium)
- Jernbaneverket (JBV) (Norway)
- Keyrail (Netherlands)
- MAV Magyar Államvasutak Zrt (MAV) (Hungary)
- National Railway Infrastructure Company (NRIC) (Bulgaria)
- Network Rail (Great Britain)
- PKP Polskie Linie Kolejowe S.A. (PKP PLK) (Poland)
- ProRail B.V. (Netherlands)
- Public Agency for Rail Transport of RS (AŽP) (Slovenia)
- Rede Ferroviária Nacional E.P. (REFER) (Portugal)
- Réseau Ferré de France (RFF) (France)
- Rete Ferroviaria Italiana SpA (RFI) (Italy)
- Scandlines Deutschland GmbH (Germany/Sweden)
- Société Nationale des Chemins de fer Français (SNCF) (France)
- Swiss Federal Railways SBB-Infrastructure (SBB CFF FFS) (Switzerland)
- ŠŽ Slovenske železnice d.o.o. (ŠŽ) (Slovenia)
- Swiss Train Paths Ltd. (Switzerland)
- Vasúti Pályakapacitás-elosztó Kft. (VPE) (Hungary)
- Železnice Slovenskej republiky (ZSR) (Slovakia)
- ÖBB Infrastruktur Betrieb AG (Austria).

Network Statements of Other Countries

Internet addresses and names of Network Statements published by other rail network administrators are listed in Appendix 13.

1.10 Glossary

- **Coordination** refers to a procedure by which RHK and the applicants attempt to solve situations where there are competing requests for rail capacity.
- **Infrastructure maintenance** refers to construction, maintenance and development of tracks, of structures, equipment and systems connected with them, as well as of real property needed for infrastructure maintenance.
- **LIMO** refers to the Finnish Rail Agency's orders and instruction on rolling stock.
- **Museum train traffic** refers to traffic operated on a small scale on the rail network by a non-profit association with museum trains. Museum train refers to a stock registered as a museum train on the Finnish Rail Agency's stock register.
- **Private siding** refers to a track other than state-owned track, which is connected to the rail network according to the private siding connection permit. The connection permit is provided by the Finnish Rail Administration.
- **Rail capacity** refers to the capacity of a train path to carry train traffic over a particular period and depending on the characteristics of the rail network.
- **Rail Network Description** refers to the technical characteristics of the Finnish rail network. The information published on the description are up-to-date on the date of publication, and describe the current state. Rail Network Description is published at least twice a year, at the beginning of June and December, on RHK's website.
- **Railway undertaking** refers to a company or other association under private law whose main activity is to operate rail traffic. The company must have an appropriate operating licence issued in the European Economic Area and possess the rolling stock needed for operating traffic. Undertakings providing only traction services are also regarded as railway undertakings.
- **RATO** refers to railway track's technical instructions, which include basic information on development, inspection and maintenance of a track and its equipment.
- **The Advance Information System (ETJ)** is a system, which includes the advance plans of railway work and information on changes affecting traffic. Otherwise, these would have to be delivered by a traffic control message.

- **Traffic control** is the management of traffic on individual train paths. In addition traffic control duties include issuing permits and notices required for train traffic. Traffic control also includes protecting the railway work areas, issuing permits for railway work and receiving information on the termination of such work. If so required due to the volume of traffic and safety apparatus a signals or turnout worker, shunting foreman, engine driver or a worker responsible for the safety of work done near the tracks or other person appointed in due order for the task may participate in traffic control to the extent required by their task.

2 Access Conditions

2.1 Introduction

Access requirements to the rail network are listed in this chapter. The prerequisites for operating railway traffic are an operating licence, safety certificate or museum traffic operator's licence, allocated capacity and an access contract. In addition, for example, the rolling stock acceptance process and traffic safety staff qualifications are described in this chapter.

2.2 General Access Requirements

The legal framework of access to infrastructure is described in the Railway Act (555/2006). The provisions issued by the Finnish Rail Agency and RHK shall be observed on the state-owned rail network. Information on the provisions and instructions issued by the Finnish Rail Agency and RHK currently in force is available from the Finlex Data Bank, <http://www.finlex.fi>.

The Act on safety and interoperability of the rail system (750/2006) lays down, for example, the essential requirements for the rail system. The essential requirements can be supplemented with separate provisions.

As of 1 January 2009, all stock registered in traffic as trains, must use automatic train protection (ATP) equipment. Stock used only for shunting does not need to have ATP engine equipment. Museum stock can be operated on part of the rail network without automatic train safety equipment. The sections of line, on which the automatic train safety equipment is obligatory, are listed in Finnish Rail Agency's museum train traffic regulations. Further information from the Finnish Rail Agency.

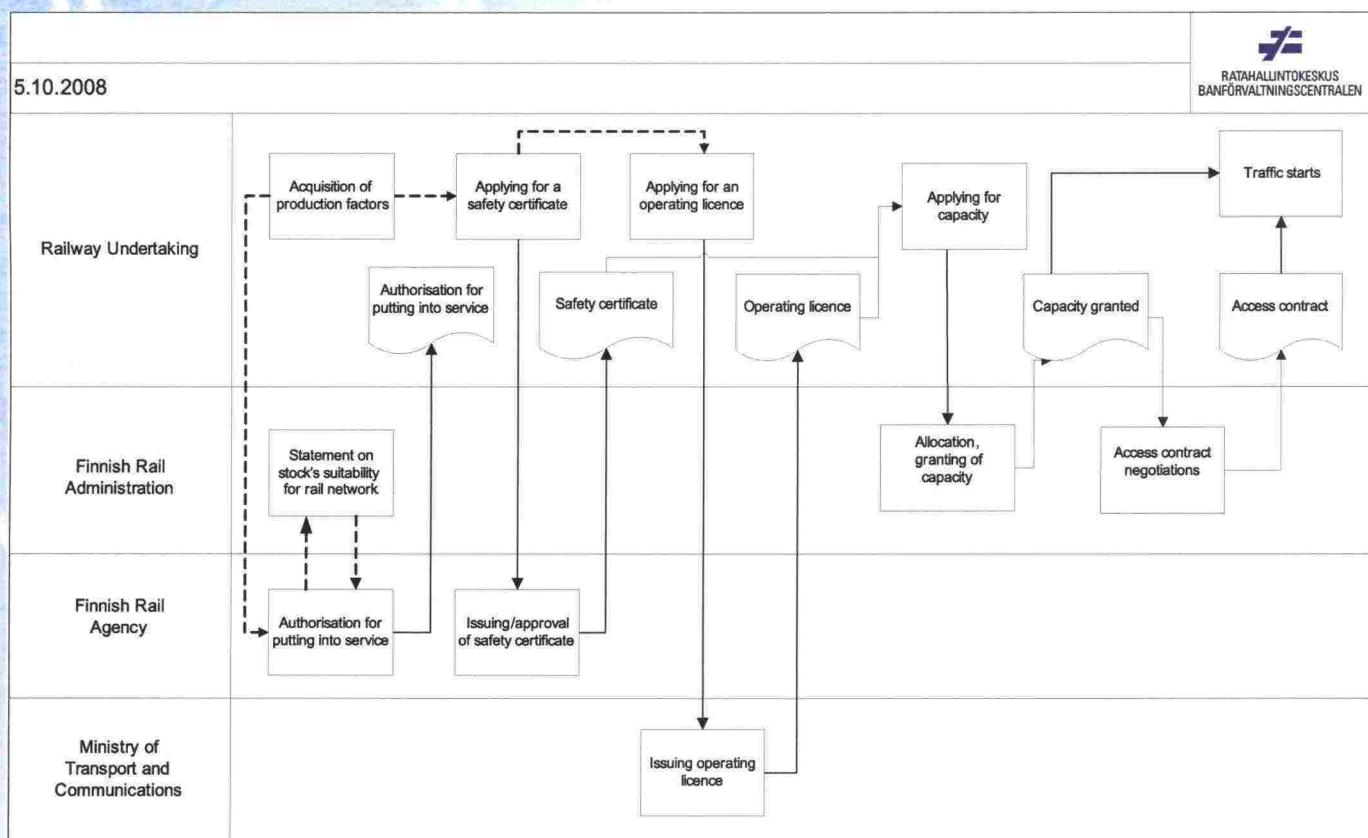

Figure 2. Phases for entering the market

2.2.1 General Requirements for Operating Railway Traffic

Operation of rail traffic on the state-owned rail network requires that the railway undertaking meet the following conditions:

- 1) The railway undertaking or international grouping of railway undertakings shall have an operating licence in accordance with the Railway Act or a corresponding operating licence issued in the European Economic Area, unless the question is of museum train traffic referred to in the Railway Act.
- 2) The licence holder shall have a safety certificate in accordance with the Railway Act, issued or approved by the Finnish Rail Agency, which covers all the train paths on which traffic will be operated.
- 3) Capacity in accordance with the Railway Act has been allocated to the railway undertaking for its traffic.
- 4) The licence holder shall make an access contract with RHK on necessary practical arrangements concerning the operating of railway traffic.
- 5) Other conditions for operating rail traffic, laid down in or under the Railway Act are in all respects fulfilled.

Access conditions and phases for entering the market are presented in Figure 2.

Museum Traffic

The same requirements described in this Network Statement are applied to museum train traffic as to other rail traffic, except with regard to the operating licence. The law provides that a museum traffic operator must have an operating licence granted by the Finnish Rail Agency, and that the licence corresponds with the railway undertaking's safety certificate. The operating licence will be granted upon application for a maximum of five years at a time. The prerequisite for granting the operating licence is that the museum traffic operator has sufficient liability insurance and risk management system, their rolling stock has been approved by the Finnish Rail Agency, and the persons attending to the traffic operation possess the required competence.

Capacity may be requested only as ad hoc capacity. RHK has drawn up instructions for museum train traffic operators for attending to certain matters regarding access to the network.

As of 1 January 2009, all stock registered in traffic as trains, must use automatic train protection (ATP) equipment. Museum stock can be operated on part of the rail network without automatic train safety equipment. The sections of line, on which the automatic train safety equipment is obligatory, are listed in Finnish Rail Agency's museum train traffic regulations. The regulation will come into operation on 1 November 2008. Further information from the Finnish Rail Agency and Finlex.

2.2.2 General Requirements for Access to the Rail Network

The following railway undertakings or international groupings of railway undertakings may access the state rail network to operate train traffic.

- 1) the railway undertakings and international groupings of railway undertakings referred to in the Railway Act providing domestic freight services or passenger services in international rail traffic between states belonging to the European Economic Area;
- 2) the rail transport operating subsidiary of the limited company referred to in the Act on the Incorporation of the Finnish State Railways (20/1995) for providing services in domestic passenger traffic, as well as in traffic between Finland and Russia.

These railway undertakings and international groupings of railway undertakings may use the rail network in accordance with the Railway Act and the traffic operating points on the state-owned rail network for their traffic operating on separately agreed conditions (access contract). Other undertakings or associations may also use individual traffic operating points on the rail network for their rail services, provided that this traffic serves a private siding connected to a traffic operating point and that an agreement on traffic operating has been made with RHK.

2.2.3 Operating Licence

The Ministry of Transport and Communications issues an operating licence for the operation of rail traffic to applicants established in Finland. The granted operating licence is valid for the time being and the Ministry reviews the operating licence and its conditions every five years. An operating licence issued in one state belonging to the European Economic Area is valid throughout the territory of the European Economic Area. An operating licence granted elsewhere must be delivered to the Ministry of Transport and Communications for information.

The prerequisite for granting the operating licence is that the main activity of the undertaking is to operate rail traffic. The undertaking must also have a safety certificate issued or approved by the Finnish Rail Agency, a solid financial standing, a competent management team and a sufficient liability insurance. The application for an operating licence is delivered to the Ministry of Transport and Communications.

2.2.4 Safety Certificate

The safety certificate is issued by the national safety authority. In Finland, it is issued by the Finnish Rail Agency. If the railway undertaking possesses a safety certificate granted in another country in the European Economic Area, it need not apply for a new safety certificate. The safety certificate granted in another country must be approved by the Finnish Rail Agency. The safety certificate will be granted or approved for a maximum of five years at a time. The undertaking must apply for a new safety certificate as soon as its old certificate is no longer valid.

The safety certificate consists of two parts. Part A is used to confirm the acceptance of the railway undertaking's safety management system in the whole of the European Economic Area. Part B ensures that the railway undertaking meets the special requirements needed for the safe use of the rail network in question.

The purpose of the safety certificate is to ensure that the applicant fulfills the safety requirements for its operations and that the undertaking has the necessary qualifications to operate safely on the rail network. These requirements are presented in the Railway Act. It is also possible to include other requirements in the safety certificate regarding railway safety. The purpose of these requirements is ensure railway safety while taking into consideration the nature and scope of the railway traffic of the applicant. The aforementioned requirements are presented in more detail and explained in the instructions on how to apply for a safety certificate drawn up by the Finnish Rail Agency.

The Finnish Rail Agency requires information on:

- applicant's safety management system and other arrangements by the undertaking and its management ensuring that regulations concerning rail traffic safety are observed
- applicant's management and personnel in charge of traffic safety is competent and professionally trained
- applicant's rolling stock meets the set requirements and its service and maintenance has been properly arranged and
- applicant has sufficient insurance or some other arrangement.

The Finnish Rail Agency has drawn up instructions on how to apply for a safety certificate. The form used to apply for the safety certificate can be obtained from the Finnish Rail Agency. The written application shall be submitted to the Finnish Rail Agency. The Safety Department shall consider the application and if necessary request further information. The Finnish Rail Agency shall decide on the issuance or approval of the safety certificate within four months after the request has been filed. The Finnish Rail Agency may grant a safety certificate for the entire state rail network or individual train paths. If the nature or scope of the undertaking or international grouping of railway undertakings changes fundamentally, it shall apply for a new safety certificate or request that the Finnish Rail Agency reapproves the safety certificate.

2.2.5 Insurance

A rail transport operator shall have sufficient liability insurance or other corresponding arrangement in case of such damage incurred by a party due to rail transport operations for which the operator is by law or contract responsible. The nature and scope of operations and risks related to the operations must be taken into account in evaluating the sufficiency of the insurance or a similar arrangement. The insurance or other corresponding arrangement shall be in force for the duration of the entire period during which rail transport is operated.

2.3 How to Apply for a Train Path

A railway undertaking has to meet the following criteria to apply for rail capacity:

- The undertaking shall have an operating licence in conformity with the Railway Act or a corresponding licence issued in the European Economic Area unless it is a question of museum traffic referred to in the Railway Act.
- The undertaking shall, in compliance with the Railway Act, have a safety certificate for all the train paths on which the undertaking is planning to operate.

Applying for rail capacity and capacity allocation are described in Chapter 4 of the Network Statement.

2.4 General Business Conditions

2.4.1 Framework Agreement

RHK may make a framework agreement on the use of capacity with applicants for capacity. The purpose of such an agreement is to specify the characteristics of the capacity requested by the applicant. The framework agreement does not, however, entitle the applicant to obtain such capacity as is specified in the agreement.

Railway undertakings shall request the capacity specified in the framework agreement for each timetable period separately. If requested, RHK allocates the capacity specified in the framework agreement following the procedure laid down in the Railway Act. Correspondingly, the access contract shall be concluded for each timetable period separately regardless of the framework agreement. The framework agreement does not, however, impede the application of the provisions of the Railway Act to other applicants for capacity.

The framework agreement is made for a maximum of five years. For special reasons, RHK may, however, also conclude framework agreements for a longer period. Conclusion of an agreement for more than five years can, however, be justified only by contracts, special investments or special business risks connected with the transport business of the party with which the agreement is concluded, as well as by the large-scale and long-term investments of the party with which the agreement is concluded or the contractual obligations connected with such activities.

2.4.2 Access Contract

Railway undertaking and museum traffic operator shall make an access contract with RHK on the use of necessary services with regard to the state rail network and operating railway traffic. These services include, for example, the use of marshalling yards, storage sidings and other tracks, as well as use of traffic control services. It is also possible to agree on other practical arrangements concerning railway traffic operations.

The railway traffic operator shall contact RHK to prepare the access contract and contractual negotiations as early as possible, preferably before applying for capacity. RHK makes this contract with each licence holder while taking into account the nature and scale of capacity allocated. The access contract is made for each timetable period and can be changed if decisions made during the timetable period concerning the allocation of capacity or other facts, for example, concerning the condition of the rail network so require. The access contract can only be concluded after all conditions stipulated in the Railway Act for operating railway traffic have been fulfilled. After the contract has been concluded, traffic may begin.

2.5 Operational Rules

Operational rules drafted by RHK can be viewed on the RHK web site and legislative information on the Finlex web site.

2.6 Exceptional Transport

Traffic restrictions are dealt with in item 3.4. Regulations concerning railway traffic and rolling stock can be viewed on the Finlex web site and other instructions on the Finnish Rail Agency and RHK web sites.

The admission practices of special transport permits will be changed. Further information on changes will be published on RHK's website and the Network Statement 2010 website.

2.7 Dangerous Goods

Transport of dangerous goods is dealt with in item 3.4.3. Regulations concerning railway traffic and rolling stock can be viewed on the Finlex web site and other instructions on the Finnish Rail Agency and RHK web sites.

2.8 Rolling Stock Acceptance Process Guidelines

An authorisation issued by the Finnish Rail Agency is required for placing rolling stock in service. This authorisation can be issued for rolling stock that meets the requirements valid in Finland, which is laid down in legislation.

The requirements are based on the interoperability requirements for the rail system in accordance with Community law and the Finnish Rail Agency has issued complementary and more detailed instructions. Conformity can be proved by the EC Declaration of Conformity or a corresponding declaration issued within the European Economic Area. Before issuing the authorisation, the Finnish Rail Agency will ask for the Finnish Rail Administration's statement on stock type's or unit's suitability for rail network, in order to define possible restrictions.

The Finnish Rail Agency maintains a register used to monitor the validity and traffic safety of rolling stock. The purpose is to promote railway system safety and identify rolling stock. The rolling stock is recorded in a register maintained by the Finnish Rail Agency, if the rolling stock has been granted a commissioning licence in Finland. Rolling stock that will be used on the state's rail network and has been granted a commissioning licence elsewhere within the European Economic Area or in a country outside the EEA must also be recorded in the register. Any rolling stock used on private sidings will also be recorded in the register.

The Finnish Rail Agency can also register rolling stock for a limited time upon request. A fixed-period registration is also possible for any rolling stock that has been granted a commissioning licence in another country, if it has been granted a commissioning licence in Finland and is used on the state's railway network only temporarily.

The rolling stock register must include information on the owner, holder and renter of the rolling stock. The more detailed regulations on related information on other rolling stock to be recorded in the register will be set forth in a Council of State decree.

With regards to any rolling stock used for rail traffic between Finland and Russia, the register must include information on the vehicle owner or renter, any possible limitations on the vehicle use and information on the vehicle's maintenance plan in so far as is essential to the vehicle safety.

The Finnish Rail Agency provides more detailed information about the requirements and other matters related rolling stock.

2.9 Staff Acceptance Process

Traffic safety staff shall meet the health, training and other qualification requirements laid down in Finnish legislation. Specific provisions on qualifications are laid down in the Traffic Safety Tasks Act which came into force on 1.1.2005. The Act lays down qualification requirements for personnel working with traffic safety tasks which have a direct impact on rail traffic safety. Those working in these tasks shall also meet the Finnish Rail Agency requirements concerning health, training and other qualifications. The qualification requirements vary depending on the job.

Before the Finnish Rail Agency issues or approves a safety certificate, the railway operator shall provide it with information on the qualifications of its traffic safety staff. A museum traffic operator must provide the Finnish Rail Agency with the corresponding information for issuing the operating licence. If necessary, the Finnish Rail Agency may upon issuing the safety certificate or operating licence examine in other ways and in more detail whether a person or persons employed by the railway traffic operator or otherwise connected to his or her operation meets the set qualifications.

3 Infrastructure

3.1 Introduction

The infrastructure refers to the state-owned rail network managed by RHK. RHK is responsible for infrastructure maintenance that is, for the construction and maintenance of tracks, of structures and equipment connected with them, as well as of real property needed for infrastructure maintenance.

3.2 Extent of Network

3.2.1 Limits

The available network is presented graphically in Figure 3 (state-owned rail network in the beginning of timetable period 2010) and in Appendix 1 (Infrastructure Register).

The following line sections are closed to traffic:

- Kankaanpää–Niinisalo
- Kihniö–Aitoneva
- Raudanlahti–Säynätsalo
- Pesiökylä–Taivalkoski
- Kolari–Äkäsjoki
- Niesa–Rautuvara.

Maintenance has been cancelled until further notice:

- Lautiosaari–Elijärvi

Maintenance planned for completion:

- Kiukainen–Säkylä (from 13 December 2009 onwards)

RHK cannot guarantee the operability of the following track sections during the timetable period of 2010 at the time publishing the Network Statement:

- Kiukainen–Säkylä
- Parkano–Niinisalo

All changes will be published on the RHK website.

3.2.2 Connected Railway Networks

There is a rail connection from Finland to Sweden via Tornio. The main outlines of traffic operating on the Tornio–Haapavesi line section are presented in Appendix 3. The Swedish infrastructure manager is Banverket.

The Finnish train safety regulation will be changed on 1 November 2008. Appendix 3 will be updated. The updated appendix will be published on the Network Statement website and Finlex.

A rail connection exists from Finland to Russia via Vainikkala, Imatranksi, Niirala and Vartius. Rail traffic between Finland and Russia is based on the Rail Traffic Agreement between Finland and Russia. Traffic between Finland and Russia is not internal international traffic within the European Economic Area. Only VR Limited has access to the Finnish rail network in traffic between Finland and Russia.

3.3 Network Description

3.3.1 Geographic Identification

3.3.1.1 Track Typologies

The network is presented in Figure 3 (rail network map) and in the infrastructure register (Appendix 1).

3.3.1.2 Track Gauges

The nominal track gauge on the rail network 1,524 mm. The speed-dependent limit values for the track gauge are indicated in the Ratatekniset ohjeet (RATO) publication, part 13 "Radantarkastus" (Track inspection).

3.3.1.3 Stations and Nodes

The available traffic operating points (stations) are presented in Figure 4 (rail traffic operating points) and in Appendix 2 (Rail Traffic Operating Point Register).

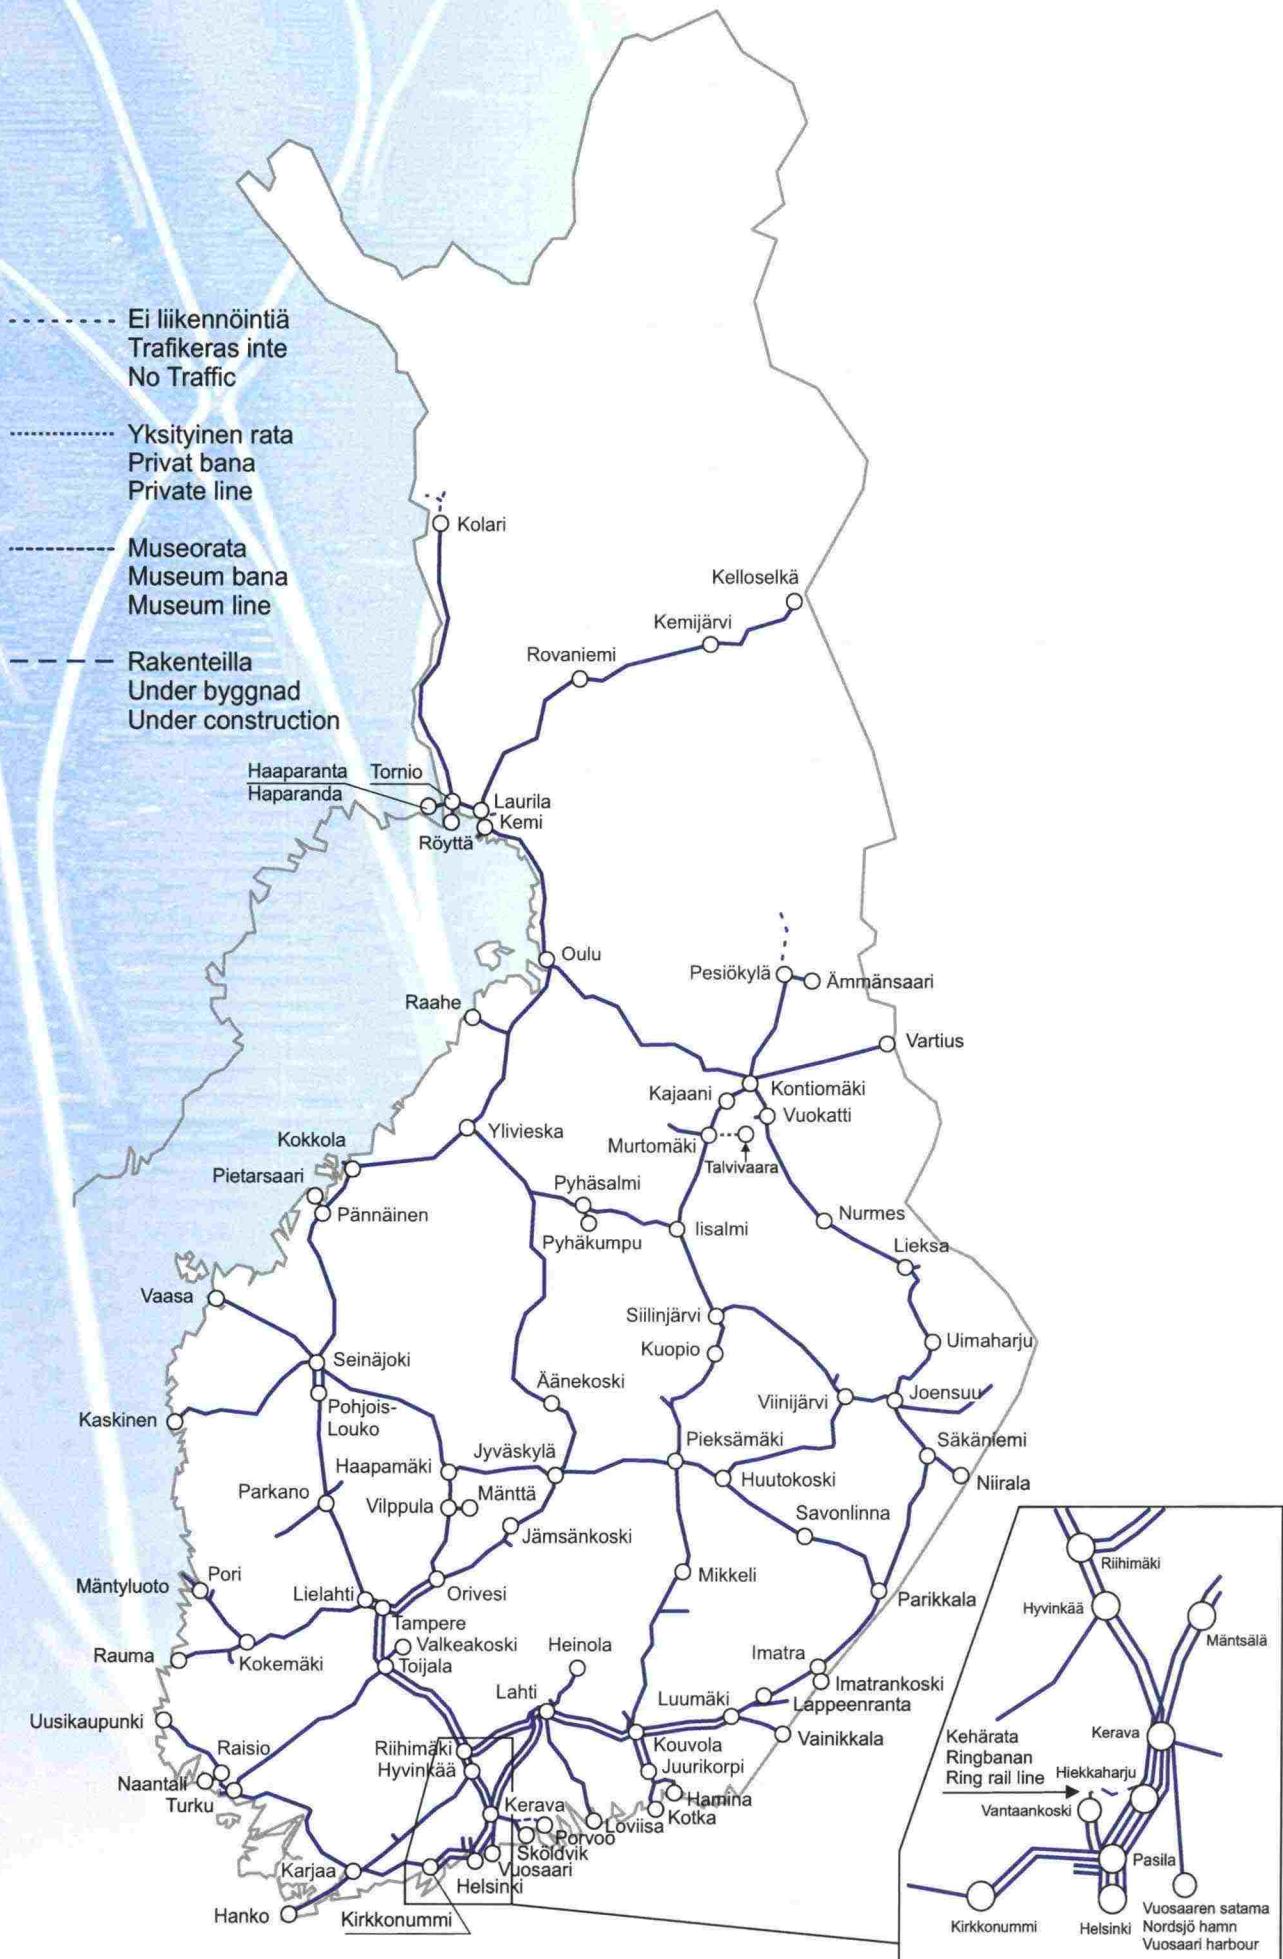

Figure 3. State-owned rail network at the beginning of timetable period 2010.

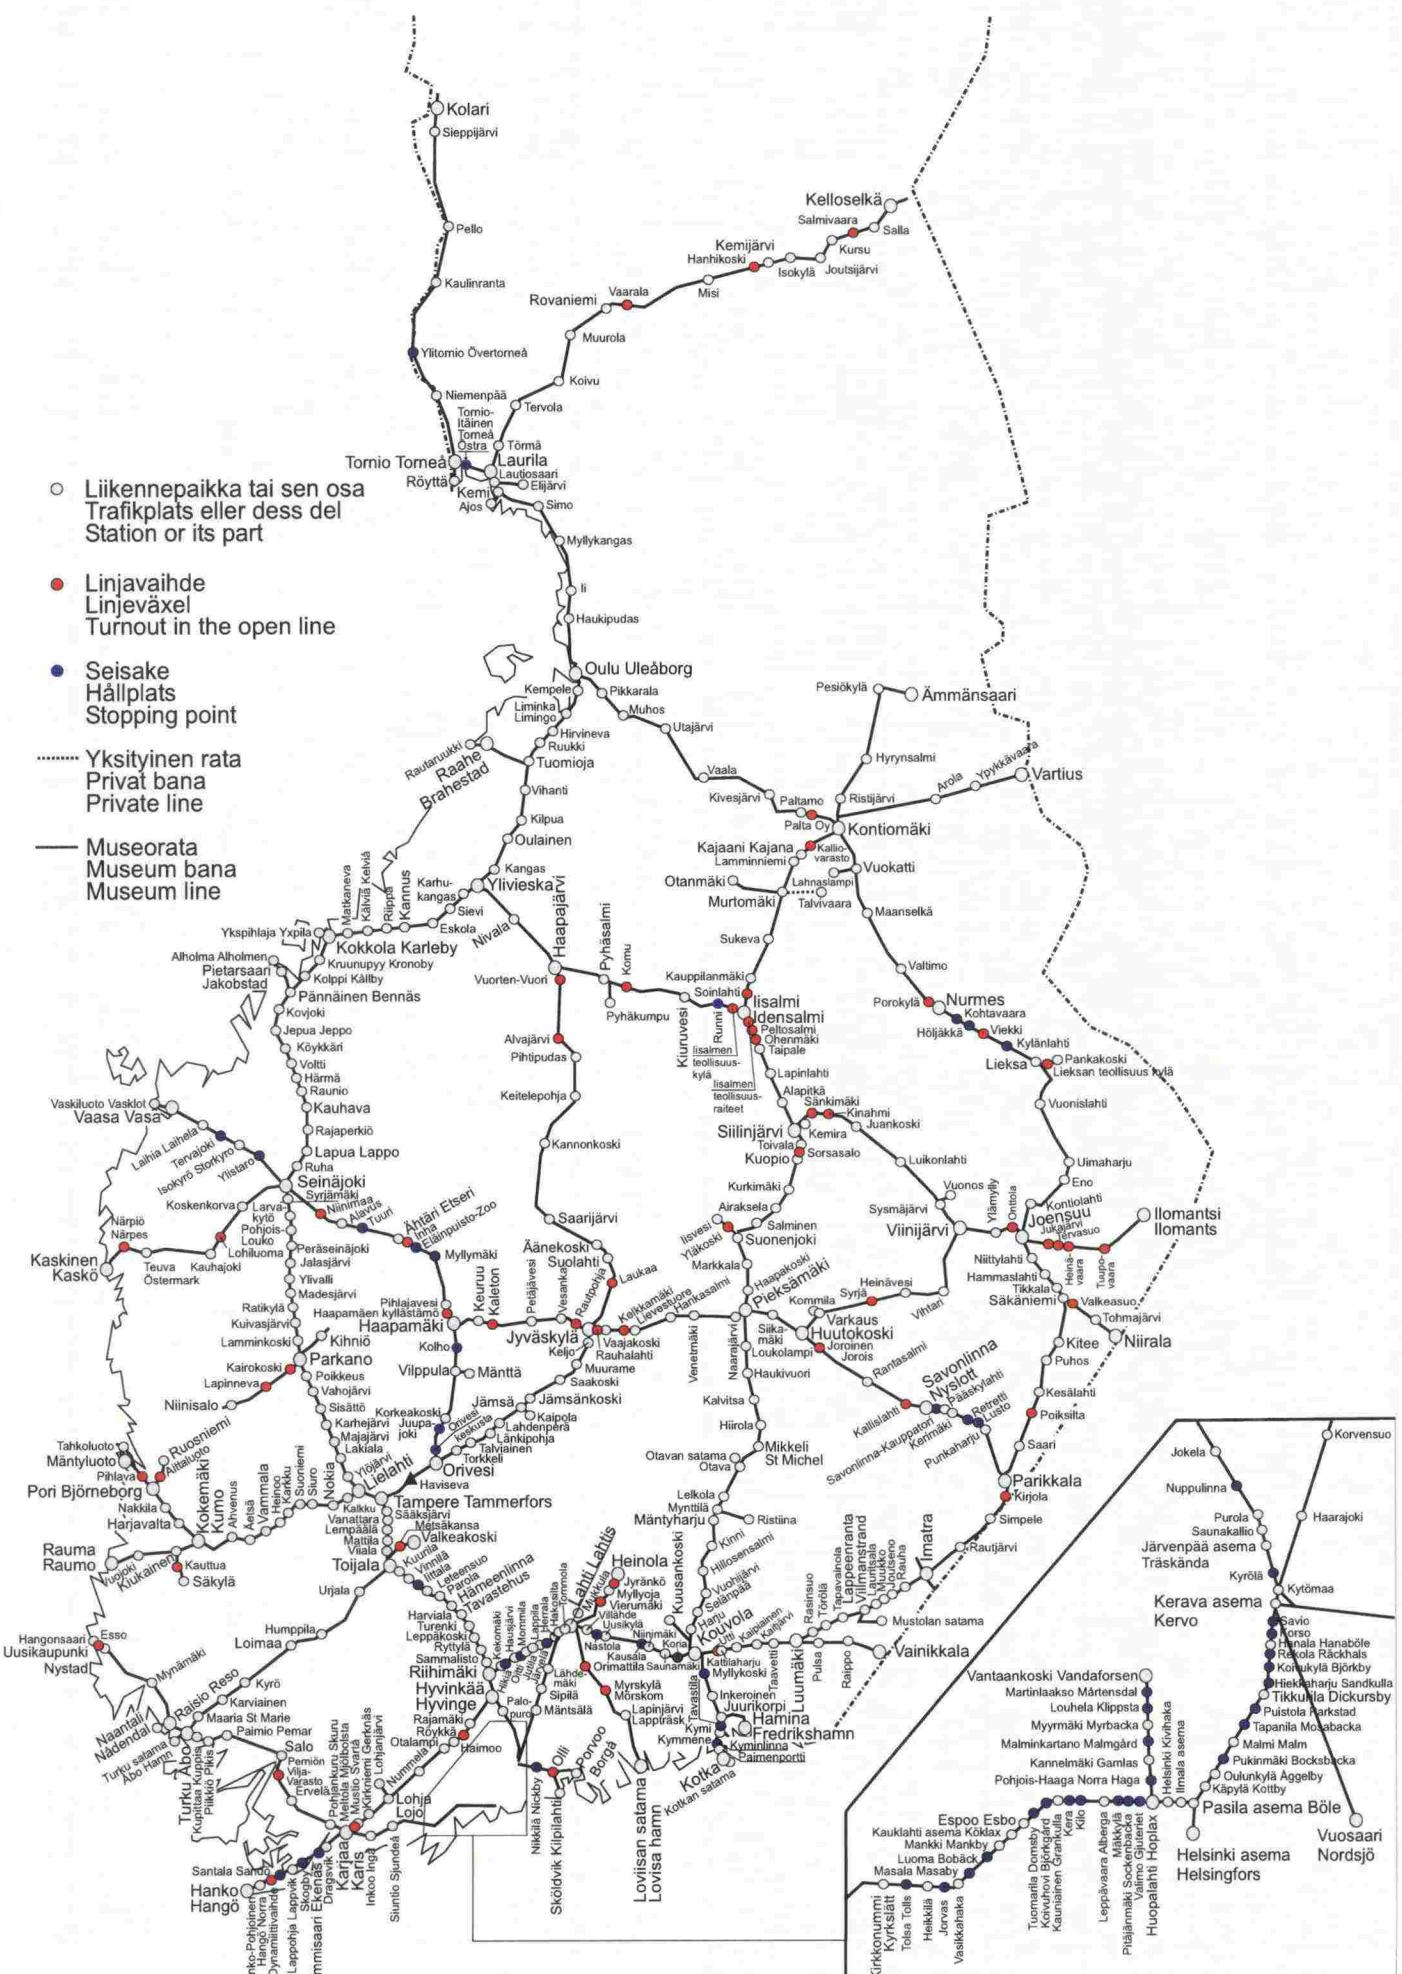

Figure 4. Traffic operating points on the state-owned rail network at the beginning of timetable period 2010.

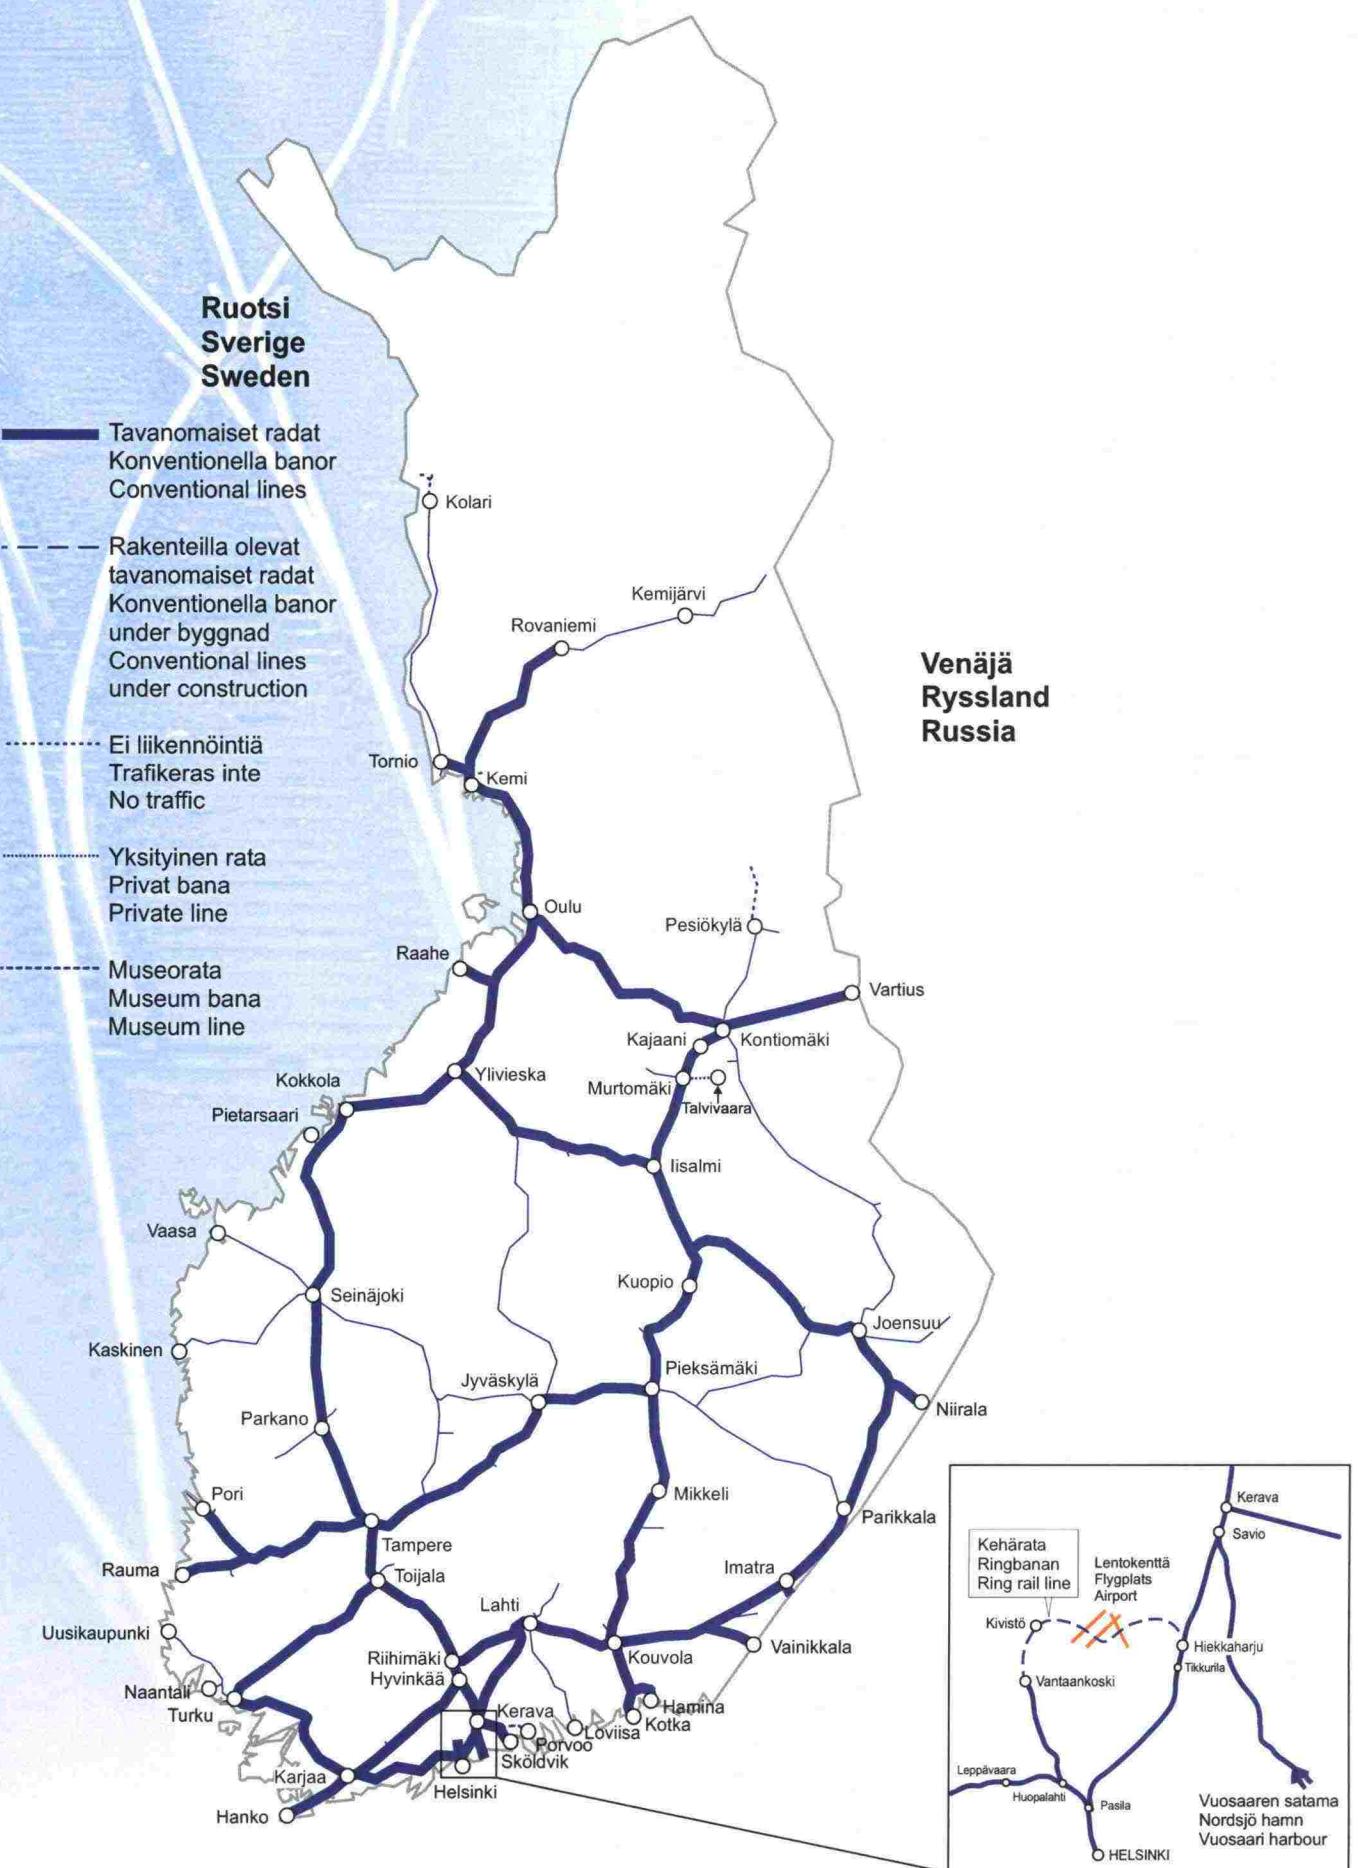

Figure 5. Trans-European Rail Network in Finland (The Finnish TEN network)

3.3.2 Capabilities

3.3.2.1 Loading Gauge

The loading gauge (KU), Appendix 4, and the structure gauge (ATU), Appendix 5, are used throughout the state-owned rail network. On private industrial sidings, there may be both loading and structure gauge limitations, which railway undertakings shall clarify separately for carrying out transportation.

The vehicle gauge (LKU) is specified in the Finnish Rail Agency's LIMO publication, point 1 "Yleiset määrykset" (General rules).

3.3.2.2 Weight Limits

Axle loads

22.5 ton axle loads are permitted on most of the rail network. The maximum permitted axle loads per line section are indicated in Appendix 6 (Superstructure Categories and Permitted Speeds for Different Axle Loads).

Metre Loads

The permitted metre load of rolling stock throughout the state-owned rail network is 8.0 tons/m.

3.3.2.3 Line Gradients

The maximum gradient is 20 mm/m on the main lines and 22.5 mm on the secondary lines. The maximum gradient of sections of line measured over a distance of 1,200 metres is presented in Appendix 1 (Infrastructure Register).

3.3.2.4 Line Speeds

The maximum speed is 220 km/h for passenger trains and 120 km/h for freight trains. The speeds permitted for passenger and freight trains on the rail network are indicated in Appendix 6 (Superstructure Categories and Permitted Speeds for Different Axle Loads).

3.3.2.5 Maximum Train Lengths

The maximum train length permitted on a line section shall be such that trains can also use secondary tracks at the traffic operating points. Trains need not, however, be capable of using all secondary tracks at all traffic operating points. The train lengths used for dimensioning line sections are 550, 625, 725, 825 and 925 metres. The longest secondary tracks at each traffic operating points are indicated in Appendix 2 (Rail Traffic Operating Point Register).

3.3.2.6 Power Supply

The nominal voltage of the electrification is 25 kV/50 Hz AC. On all electrified lines, power is taken from the contact line above the track. One or both of the running rails and return conductors form a return circuit. The neutral sections will be located at the overhead line near substations. Rolling stock cannot collect current from these neutral sections. The main switch of locomotive/electric train must be opened at the neutral sections. The train is not allowed to stop at a neutral section.

The maximum zigzag of the contact wire is 400 mm. The contact wire height can vary from 5600 to 6500 mm. The normal height is 6150 mm. The electrified line sections are indicated in Appendix 1 (Infrastructure Register).

For fixed installations, electrification is described in part 5 "Sähköistetty rata" (Electrified railway) of the Ratatekniset ohjeet (RATO) publication, and for the electric equipment of rolling stock in the LISO publication.

3.3.3 Traffic Control and Communications Systems

3.3.3.1 Signalling Systems

The signalling systems in use are indicated in Appendix 1 (Infrastructure Register) and graphically in Appendix 7 (Signalling Systems).

A line with section block is a line divided into block sections. Only one train may be in a block section at a time. Issues related to section blocks are presented in RATO publication, part 6 "Turvalaitteet" (Signalling systems).

Hot box detectors have been placed on the rail network at 50 km intervals on line sections on which the greatest speed is or can be over 160 km/h. In addition hot box detectors have been placed near the busiest junction stations. A map of the location of the hot box detectors is presented in Appendix 7.

3.3.3.2 Traffic Control Systems

The line sections equipped with an automated traffic control system are indicated in Appendix 1 (Infrastructure Register) and in Appendix 7 (Signalling Systems). The following automated traffic control systems are used: centralised traffic control; train detection and train integrity monitoring; and radio control. On the CTC- and radio-controlled lines, all routes are equipped with the remote control of points and routes. On the secondary, loading and storage sidings of these line sections, however, local route setting may also be necessary. On radio-controlled lines, routes shall be set locally if it is necessary to operate on secondary, loading or storage sidings.

3.3.3.3 Communications Systems

All communication between traffic control, traffic operators and railway work must take place in Finnish. Traffic control, driver and the person responsible for the railway work must have access to the information stated in the regulations and working instructions.

The Finnish Rail Agency sets regulations on, for example, traffic operation, railway work and communications. The valid regulations can be obtained at the Finnish Rail Agency website at <http://www.rautatievirasto.fi>.

RHK provides working instructions that deal with traffic control, traffic operation, railway work and communications, and complement the regulations. The valid working instructions can be obtained at the RHK website at <http://www.rhk.fi>. Contact information for traffic control can be obtained at the RHK Extranetsite.

Information of abnormal events or situations will be provided via the Advance Information System, maintained by RHK, and through notifications given by the traffic control. Drivers and persons responsible for the railway work must have knowledge of the advance notifications that are valid for the duration of the work/journey and in the working area/track sections of the journey. They must also have the contact information for the traffic control.

RHK tries to record the verbal communication between the traffic control, traffic operators and railway workers, i.e. permits and notifications, in the most comprehensive manner possible. The authorities will use these recordings for monitoring verbal communication and examining accidents and dangerous situations.

A new communications system, RAILI Network, will be taken into use on the state-owned rail network at the beginning of 2009. The RAILI network includes a new GSM-R radio network, which complies with the technical railway interoperability specifications of the European Union. The supplementary communications network of traffic control dispatchers will be introduced simultaneously. The old analogue radio networks (railway yard and line radio networks) will be abandoned once RAILI is fully implemented. The GSM-R radio network will cover most of the state-owned rail network. Some track sections will remain outside the RAILI network, but on the other hand, the RAILI network offers good coverage for hand-held radios in certain operating points. Detailed quality information can be found in the map and appendices of the RAILI network design standards. More information can be found on the RHK website at <http://www.rhk.fi>.

Traffic control, railway undertakings and contractors must use the RAILI network as their primary communications channel. If RAILI network cannot be used for a technical reason or poor GSM-R radio network reception, the parties must use other available phone or mobile phone networks. The traffic control, and also train drivers, shunting managers and persons responsible for the railway work must be informed of any faults preventing or hindering the use of RAILI network, and alternative contact information in accordance with the communications instructions.

3.3.3.4 ATP Systems

Automatic train protection (ATP) is a system that controls the speed of a train.

As of 1 January 2009, train traffic can only be operated with stock, which has ATP engine equipment or with stock, for which the Finnish Rail Agency has given a fixed-period exceptional permit, allowing operations without ATP engine equipment. The exceptional permit can be granted only for temporary traffic. It is not granted for train units or engines used in passenger traffic. Stock used only for shunting does not need to have ATP engine equipment. Further information from the Finnish Rail Agency.

3.4 Traffic Restrictions

3.4.1 Specialised Infrastructure

RHK may designate a train path or a part of it as specialised infrastructure, if there are sufficiently alternative routes for other traffic. Specialised infrastructure refers to a train path or a part of it on which priority is given to the type of traffic for which the infrastructure is specialised. So far RHK has not designated any line section in Finland as specialised infrastructure.

3.4.2 Environmental Restrictions

The requirements laid down in the Finnish Rail Agency's LIMO publication are applied when registering rolling stock. LIMO sets out general and special requirements for rolling stock concerning noise, vibration, electromagnetic interferences, emissions, environmentally dangerous substances and the use of recycled construction materials.

Vibration-related speed restrictions are imposed on parts of the railway line on fourteen line sections throughout Finland. The restrictions mainly apply to over 3,000 ton gross weight heavy trains (Appendix 8).

3.4.3 Dangerous Goods

Finland has signed the intergovernmental OTIF Convention, which regulates international rail traffic. Russia and other CIS countries have not acceded to the OTIF Convention. One of the annexes to COTIF are the Regulations concerning the International Carriage of Dangerous Goods by Rail (RID). The RID Regulations apply as such to the international rail transport of dangerous goods. The domestic rail transport of dangerous goods is regulated by the provisions transposed into Finnish legislation in accordance with the RID framework directive (96/49/EC).

The most important differences compared to the RID regulations are as follows: cold resistance requirement for certain packaging and tanks in domestic traffic is -40°C (RID -18 and -20°C); as well as the regulations concerning protection wagons and the bringing of wagons loaded with explosives to traffic operating points and the temporary storage of explosives. The decree of the Ministry of Transport and Communications also takes into account the requirements of the VOC directive (94/63/EC) concerning the recovery of vapours from petrol in connection with rail transport.

No absolute restrictions have been imposed on the transport of dangerous goods if carried out according to the regulations. It is recommended that wagons loaded with dangerous goods should not be parked in densely populated or groundwater areas. The transport of dangerous goods on tracks with spike fastening or laid with 43 kg rails shall be avoided.

It is prescribed by Government decree that railway undertakings shall carry out a safety analysis for railway yards through which considerable quantities of dangerous goods are carried. The decree defines, for example, the following: The Finnish Rail Agency defines those rail yards for which the safety analysis must be carried out. The Finnish Rail Administration may define the form of the safety analysis. The Finnish Rail Administration organises co-operation between railway undertakings in order to carry out the safety analysis. The safety analysis shall be submitted to the local rescue and environmental authorities for an opinion. The safety analysis shall be submitted to the Finnish Rail Administration, which delivers it further for approval. The safety plan is approved by the Finnish Rail Agency.

3.4.4 Tunnel Restrictions

There are tunnel restrictions on the Helsinki–Turku line section. The restrictions are indicated in Appendix 9.

Only freight trains and stock related to rail work are allowed to operate in Vuosaari tunnels. It is forbidden to take passengers through the tunnels on Vuosaari track. Only electric freight traffic is allowed.

In Vuosaari tunnels the engine driver, shunting manager and person responsible for the railway work must have a RAILI phone, and the engine driver must have oxygen apparatus.

3.4.5 Bridge Restrictions

Bridge restrictions are described in Appendix 10.

3.5 Availability of the Infrastructure

Other restrictions than those listed in item 3.4 are described in Rail Network Description and in the Advance Notification System. Track work causing traffic restrictions is presented in Appendix 11. The Rail Network description can be found at <http://www.rhk.fi>.

The substations of the electric railway have a limited capacity for supplying power to the contact line. The power supply will shut down automatically in overload situations, which will cause a temporary power failure in the contact line.

3.6 Passenger Stations

The lengths of passenger platforms (shortest/longest) are indicated in Appendix 2 (Rail Traffic Operating Point Register). The platforms not maintained by RHK are indicated in brackets.

3.7 Freight Terminals

Loading possibilities are indicated in Appendix 2 (Rail Traffic Operating Point Register). K means “yes” and Y “private”. For loading platforms, the register lists their available length.

Private siding connections at traffic operating points are indicated by the marking “Private sidings” in Appendix 2 (Rail Traffic Operating Point Register).

3.8 Service Facilities

3.8.1 Train Formation Yards

Train formation yards are railway yards in which the layout and size of the track system make it possible to form trains. The train formation yards are indicated by the marking "Shunting" in Appendix 2 (Rail Traffic Operating Point Register).

All train formation yard tracks have not been electrified. If necessary, RHK's Rail Data Unit provides more information on the electrified tracks.

3.8.2 Storage Sidings

Storage sidings are yard tracks primarily intended for the parking of wagons and coaches waiting for a transport task. Storage sidings can also be used for other purposes required by traffic operating. The local traffic control centre determines which tracks are used as storage sidings.

3.8.3 Maintenance and Service Facilities

The 400 and 1,500 V power supply facilities for rolling stock are indicated in Appendix 2 (Rail Traffic Operating Point Register). For the 400 V power supply, also the maximum current available is indicated in amperes. The use of maintenance and service facilities requires an agreement with their owner.

3.8.4 Refuelling Facilities

The Finnish Rail Administration does not own refuelling equipment or provide refuelling services. The Appendix 2 (Rail Traffic Operating Point Register) shows the refuelling facilities on traffic operating points. The use of refuelling facilities requires an agreement with their owner.

3.8.5 Technical Equipment

The use of other technical equipment (e.g. scales, cranes, etc.) must be agreed with their respective owners. The Finnish Rail Administration does not provide this equipment for railway companies to use. The Appendix 2 (Rail Traffic Operating Point Register) shows the cranes located on traffic operating points.

3.9 Infrastructure Development

Rail network development plans are presented in RHK's Action and Financial plan for the years 2010–2013. At the end of 2006, approximately 1/5 of the rail network had a superstructure more than 30 years old and in need of renovation. The most critical challenge for the track maintenance during this planning period is the completion of the renovation, which to date has progressed well, and its extension to railway yards. At the same time increased costs brought on by the increase in the prices of technology and materials must be kept under control.

The development plans for the years beyond the period covered by the Action and Financial Plan are presented in the "Rail Network 2030" report.

The Finnish Rail Administration will adopt a new environmental strategy during 2009. It outlines the focuses of environmental work from 2009 to 2013. Climate and energy issues will be emphasised more than before. Noise and vibration issues together with protection of soil and groundwater are still significant. RHK aims at improving its eco-efficiency by better follow-up of material use and further developing recycling. Part of the strategy work is developing extensive, organisation-wide instructions on environmental issues.

4 Capacity Allocation

4.1 Introduction

The legal framework of capacity allocation is described in the Railway Act (555/2006) and in the Government Decree on the Timetable Period in Rail Traffic and Applying for Infrastructure Capacity (751/2006).

4.2 Description of Process

Capacity for operating regular train services on the state-owned rail network shall be requested from RHK for each timetable period within the time defined. Capacity for regular train services can also be requested during the timetable period. The schedule for train path requests and for allocation is shown in a diagrammatic form in Figure 6. It is also possible to make ad hoc requests for capacity for other than regular traffic.

Requesting Rail Capacity

The principles of capacity requests are described in the Railway Act (555/2006) and in the Council of State Decree on the Timetable Period in Rail Traffic and Applying for Infrastructure Capacity (751/2006). In order to specify the Act and Decree, the Finnish Rail Administration has drawn up a regulation for requesting rail capacity. The regulation and its detailed schedule and information on possible changes to rail capacity request procedures can be obtained from the Traffic Management Unit at RHK's Traffic System Department. The same information is available also on the RHK website at <http://www.rhk.fi>.

RHK started an implementation project in autumn 2007 to build an IT system for the rail capacity management (LIIKE). At the time of publishing the Network Statement, the aim is to start using the LIIKE system for handling capacity requests for regular services in 2009.

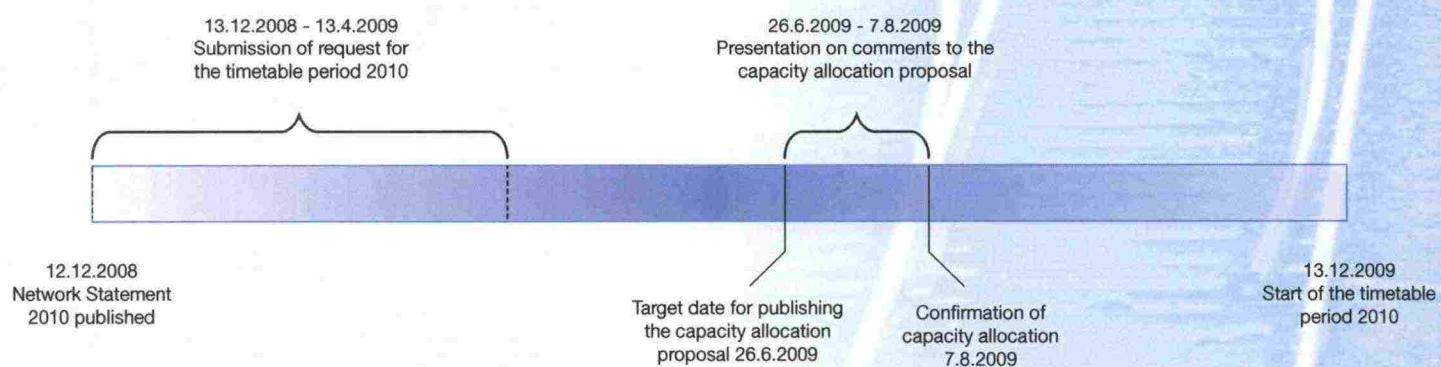

Figure 6. Diagrammatic presentation of the schedule for train path requests and for allocation process.

4.3 Schedule for Train Path Requests and Allocation Capacity Requests

4.3.1 Schedule for Working Timetable

The timetable period in rail traffic starts annually at the second weekend of December, at 00.00 hrs on the night between Saturday and Sunday, and ends at the corresponding time the following year. The timetable period 2010 will start on 13.12.2009 and end on 11.12.2010. Correspondingly, the timetable period 2011 will start on 12.12.2010 and end on 10.12.2011. Applicants for capacity shall request capacity no earlier than 12 and no later than 8 months ahead of the timetable period. One request may include all the changes in traffic to be made during the timetable period.

Decisions on the allocation of capacity for regular services may be changed for the rest of the timetable period during the timetable period concerned at specified dates, provided that these changes do not affect the capacity allocated to other railway undertakings or to international traffic within the European Economic Area. The changes may take effect at 00.00 hrs on the night between Saturday and Sunday in the beginning of the timetable period and at the weekend following the end of the school year. In addition to the above dates, the Finnish Rail Administration may for special reasons decide on other dates on which changes can take place. At the time of publishing the Network Statement, the parties have had the chance to apply for changes in the capacity allocated for regular services on given dates, which have been six weeks apart on average. The Finnish Rail Administration shall inform all railway undertakings of possible new dates on which the capacity for regular services may be changed. The decision on the dates for applying changes will also be published in Finlex at <http://www.finlex.fi>.

Requests for changing capacity allocated for regular services must be submitted no later than four weeks before the date on which the change shall take effect. When the date, on which the changes may take affect, is Sunday or a public holiday, the request shall be made on the first weekday.

4.3.2 Requesting Rail Capacity for Temporary Traffic

Applicants for capacity may request capacity from RHK regardless of the prescribed period if they urgently need capacity for one or more provisional train paths. Ad hoc capacity requests for the time period between the change dates can be made after the capacity application period has ended. Rail capacity for museum traffic can be applied no earlier than four months before the scheduled departure. The Finnish Rail Administration will announce its decision concerning the capacity request within five working days of receiving the application. The more detailed application instructions can be found in RHK's regulation on its website at <http://www.rhk.fi>.

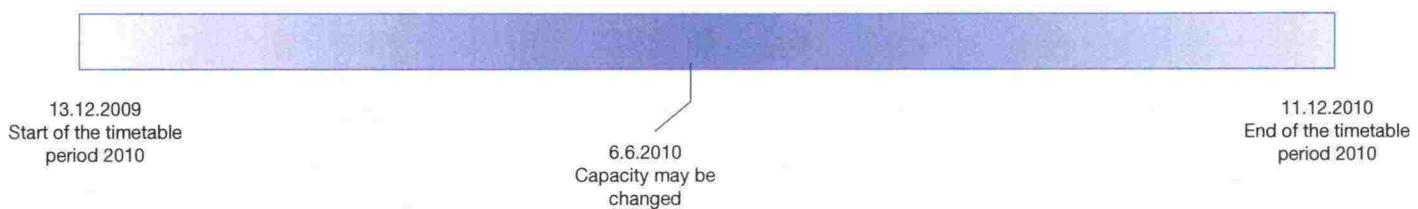

Figure 7. Dates on which the capacity for regular services may be changed during the timetable period 2010.

4.4 Allocation Process

4.4.1 Coordination Process

Based on the applications, RHK draws up the capacity allocation proposal (called “draft working timetable” in the Railway Act) for the next timetable period no later than four months after the deadline for the submission of requests for capacity. It has, however, been agreed by European railway infrastructure managers that no more than 2.5 months shall be used for the coordination of requests. The capacity allocation proposal contains information on the capacity that RHK proposes to allocate to an applicant only to such an extent and with such restrictions as is necessary for implementing traffic control for the use of this capacity.

The capacity allocation proposal is primarily based on the assumption that the requested capacity will be allocated, provided that the different train paths enable railway traffic to be operated in accordance with the technical and safety requirements. In order to improve the use of rail capacity, RHK may, however, offer applicants capacity that does not essentially differ from the capacity they have requested. RHK may also decide not to allocate capacity, provided that reserve capacity is needed for the timetable period as a result of the priority order applied to rail traffic.

RHK sends the capacity allocation proposal to applicants for information within the prescribed period of time and gives them the opportunity to comment. Comments shall be presented within 30 days after receipt of the capacity allocation proposal. Customers purchasing freight transport services and associations representing purchasers of rail transport services also have the right to present comments on the capacity allocation proposal within 30 days, counted from the date on which RHK publishes an announcement in its collection of regulations that the capacity allocation proposal has been prepared.

Coordination for the Timetable Period

If there are several applicants for the same capacity or the requested capacity affects the capacity requested by another applicant, RHK will attempt to coordinate the requests between the applicants. In such cases, RHK may offer the applicants capacity that does not essentially differ from the capacity they have requested.

If the coordination of the requests between the applicants does not lead to a satisfactory result, RHK decides on the priority order in each individual case on the grounds laid down in the Railway Act. RHK shall decide on an individual priority order no later than ten days after coordination has ended.

Confirmation of the Capacity Allocation Proposal

Based on the capacity allocation proposal and the comments presented by the parties involved, RHK shall decide on the allocation of rail capacity on a fair and non-discriminatory basis. In deciding, RHK shall pay particular attention to the needs of passenger and freight traffic and infrastructure maintenance, as well as to efficient use of the rail network. The priority order determined for specialised and congested infrastructure shall also be taken into account, unless otherwise provided in this chapter.

Allocating Ad Hoc Rail Capacity

RHK allocates the requested ad hoc capacity if there is sufficient capacity for the use specified in the request. Unless otherwise provided in the Railway Act, the ad hoc capacity is allocated on a first-come first-served basis.

4.4.2 Dispute Resolution

Railway undertakings may appeal against a capacity allocation decision by RHK by filing a claim for rectification with the Finnish Rail Agency's Regulatory Body. For further information, see 1.4.3.

4.4.3 Congested Infrastructure

The guidelines of transport policy for the priority order

The main guidelines of the Finnish transport policy are presented in the Government transport policy report to Parliament on 27 March 2008. The main challenge of the transport policy is preventing climate change. The climate targets set for transport are promoted by supporting public transport and solutions for pro-environmental passenger and freight traffic. Another main target is to promote logistical competence in Finland by creating conditions for smooth and cost-efficient transport.

Rail traffic is an energy efficient and pro-environmental way of transporting large numbers of passengers. An efficient traffic system based on railway traffic promotes the integration of urban community structure and Finland's regional structure. The popularity of railway traffic can be guaranteed by providing passengers with fast, regular, punctual train connections with the help of a traffic system based on regular timetables. Such system can only work on congested tracks, if fast passenger and long-distance trains receive priority over other traffic. In local traffic commuter trains should have priority over those, which stop more often. The smooth operation of fast trains is also important in the international Eastern traf-

fic, which offers considerable growth potential in passenger traffic. For climate reasons, it is important that most of this growth potential is directed towards pro-environmental railway traffic instead of its competitors, air and road traffic.

It is important to develop competence in product and raw material transport for basic industry for the environmental impacts of freight traffic and Finland's logistical competence. The prioritisation of freight trains on congested tracks can affect the competence of railway transport and the number and length of freight trains' non-profit stops and their waiting times at stations. Such extra delays will increase costs, when the circulation of stock and crew is slower. Extra stops will also increase energy consumption and emissions. The logistical benefits achieved by prioritising freight trains are most significant in regular and continuous whole train and car group transportation, connected to carefully controlled industry processes. The savings achieved by prioritisation of trains in irregular traffic are smaller.

The most significant new potential in railway transport is long-distance, thin streams of goods, which are now mainly delivered as road transports. Transferring this to railway traffic is possible by creating keen scopes for action for the combined transports. This requires that fast and punctual connections of fast freight trains, which suit the timetables, are provided for transporting trailers and containers. On congested tracks this requires high prioritisation of trains compared to other traffic.

Priority order in Finland

RHK declares an element of infrastructure or a part of it to be congested infrastructure if the coordination of several requests for the same infrastructure has not led to a satisfactory result. RHK may also designate an element of infrastructure as congested if it is evident that it will become congested during the timetable period.

If there are several applications for the same infrastructure, the priority order is as presented in Table 1. Application of this priority order is based on the assumption that each train can be defined during its whole journey by one of the terms listed in the table. The term by which the train is defined may change during the journey of the train.

Table 1. Priority order on congested infrastructure.

Priority	Traffic
1.	Synergic passenger traffic entity ¹
2.a	Express train traffic ²
2.b	Transport for the processing industry ³
3.a	Local and other passenger traffic
3.b	Other regular freight traffic
4.	Freight traffic not requiring strict transport times
5.	Other traffic ⁴

¹ The term "synergic passenger traffic entity" refers in passenger traffic to the whole of trains which form a transport system producing clear added value for customers. A system of this kind is, for example, traffic operated according to the basic interval timetable

² The term "express train traffic" refers to traffic which in some respect does not belong within the scope of the synergy-producing traffic system. International passenger traffic may belong in this category.

³ The term "transport for the processing industry" mainly refers to transport whose immediate place of destination or origin is a port or a private siding. This transport is essentially connected with total logistics management. This group includes, in particular, combined transport, transport for the wood-processing industry and transport to ports.

⁴ For example, traffic connected with track work or museum train traffic.

Derogation from the Priority Order Laid Down in the Network Statement

RHK may by a separate decision make a derogation from the general priority order laid down in the Railway Act and the Network Statement in favour of an applicant operating international traffic or such traffic as otherwise maintains or improves the functioning of the rail transport system or public transport. The same applies to cases where the rejection of the application would cause unreasonable damage to applicants, railway undertakings, international groupings of railway undertakings or to the business activities of their customers.

4.5 Allocation of Capacity for Maintenance, Renewal and Enhancements

The rail network may also be used for transferring track machines from bases to worksites, between worksites, and for maintenance purposes. Certain tracks are mainly used for maintenance purposes. A list of these tracks can be requested from RHK's Rail Data Unit of the Rail Network Department. In accordance with the Railway Act, an operating licence is required for traffic outside the area reserved for infrastructure maintenance if track machines are transferred as a train, and also if the traffic is connected to track work. The operating licence will be granted upon application for a maximum of five years at a time. The prerequisite for granting the operating licence is that the maintenance / railway work undertaking has sufficient liability insurance and risk management system, their rolling stock has been approved by the Finnish Rail Agency and those handling the traffic operation have the required competence. Moreover, track machine movements shall be agreed upon separately with RHK. The track machines running on the rail network and their crews shall meet the requirements laid down under 2.8 and 2.9.

Track works which will probably be carried out during the timetable period 2010 and which are likely to have an impact on train traffic are indicated in Appendix 11. The working programme, timing of tasks, and the breaks required for the work will change as the funding and plans become more focused. Once the Network Statement is published, RHK will maintain up-to-date information on the working programme for the upcoming timetable period, and regularly inform the rail capacity applicants about the programme. RHK will decide separately on all railway work and breaks required for their completion. The decision will be made prior to the upcoming timetable period, that is in December 2009 for the timetable period 2010.

Any required maintenance breaks or changes to an earlier decision, arising after the decision has been made, can be discussed separately, if necessary. The basic rule is that breaks requiring traffic arrangements are no longer arranged at this stage, but instead the work requested after the decision will be carried out according to (or in between) the traffic.

In addition to the aforementioned, the person or group applying for the working break must contact the regional traffic planner separately for each request and agree on the working break and its details in accordance with the RHK's working break decision no later than two months before the work is scheduled to start.

The party performing the work must have permission for track work, and if necessary, a voltage cut-off prior to starting the work in the agreed work breaks.

4.6 Non-usage Rules

RHK has the right to cancel the capacity allocated to an applicant, or a part of it, if the applicant has used this capacity over a period of not less than 30 days less than required by the threshold quota specified below. In Finland, the threshold quota for the minimum use of capacity is 80 %, except on the line sections Helsinki–Kerava, Helsinki–Vantaan-koski and Helsinki–Leppävaara, where the threshold quota for the minimum use is 95 %.

RHK may not, however, cancel the capacity if the failure to use it is due to non-economic reasons beyond the applicant or the railway operator's control. RHK always cancels the capacity for such a period during which the railway undertaking does not have a safety certificate for operating rail services.

4.7 Exceptional Transport and Dangerous Goods

For information on the transport of dangerous goods, see point 3.4.3, Dangerous Goods. Regulations concerning railway traffic and rolling stock are available on the website of the Finlex Data Bank and other instructions on the Finnish Rail Agency and RHK website.

4.8 Special Measures to Be Taken in the Event of Disturbance

4.8.1 Principles

RHK has the right to cancel the capacity completely or partially on a train path provisionally out of service due to a technical failure in the railway network, an accident or other incident.

In such case, RHK offers the operator alternative train paths, as far as possible. RHK is, however, not obliged to compensate for damage that may be caused to the operator, unless otherwise is agreed upon with the operator in conformity with the Railway Act.

4.8.2 Operational Regulation

RHK is preparing instructions on how to clear disturbances in rail traffic. The instructions can be found on the RHK website at <http://www.rhk.fi>. RHK defines the rules for managing disturbances between railway undertakings. Railway undertakings have the right to present their own proposals for instructions how to handle disturbances connected with their own trains. The liability for harm and damages caused by disturbances shall be agreed with RHK.

4.8.3 Foreseen Problems

Disturbances are to be dealt with in accordance with RHK's instructions.

4.8.4 Unforeseen Problems

RHK, railway undertakings and railway maintenance undertakings shall be prepared for railway accidents in their fields of activity. The principle is that railway undertakings and railway track contractors shall be prepared to clear their own vehicles and the transported freight off the track, as well as remedy the damage caused to the environment within a reasonable time after the accident. Each undertaking shall draw up an emergency preparedness plan, which RHK shall approve. The preparedness measures included in the plan shall be taken before traffic operating is started. The undertakings themselves bear the costs caused by the creation and maintenance of the emergency preparedness system. The costs caused by an accident are borne by the party having caused the accident in accordance with the Act on Liability in Track-Guided Traffic and the Tort Liability Act.

The Finnish Rail Administration is prepared to restore the track quickly to operable condition and within a reasonable time to the condition it had before the accident. RHK agrees thereupon when making the rail network maintenance agreements.

The Ministry of Transport and Communications decides on the emergency preparedness obligations of each undertaking, depending on the nature and extent of its activities.

5 Services

5.1 Introduction

The legal framework of capacity allocation is described in the Railway Act (555/2006).

The Council of State is currently drafting its decree on the services offered to the rail traffic operators. Services concerning the usability of the rail network are described in Appendix 2 (Rail Traffic Operating Point Register) of the Network Statement. These services may be supplied by RHK or other parties.

5.2 Services Offered by RHK

RHK offers rail traffic operators on the state-owned rail network the right against payment to utilise the train paths in accordance with the capacity granted to it by RHK, marshalling yards, storage sidings, loading tracks and other tracks and passenger platforms. RHK also offers train traffic control passenger information and public address systems at the railway stations specified in the Network Statement (Appendix 12).

Use of capacity includes the right of the traffic operator to use of RHK's electricity supply network for traffic on the electrified line sections specified in the Network Statement. RHK does not, however, provide the electricity but the traffic operator shall conclude an agreement with a service provider. RHK also does not provide refuelling facilities.

RHK can offer services on a commercial basis for the use of railway operators. The additional services could comprise, for example, the use of buildings and land areas owned by RHK.

The use of services provided by RHK is agreed upon between the parties in the access contract or in a separate lease agreement.

5.3 Services Offered by Others

Railway undertakings are obliged to supply certain services and track access to services facilities for the use of railway operators if only one undertaking provides these services and it is not possible to otherwise arrange them. The availability of services shall be negotiated and an agreement shall be concluded with the service provider. The service provider has the right to charge a payment for its services. The payment shall be equitable for all railway undertakings and reasonable with respect to the costs incurred from providing the service.

Services supplied by others may include, for example:

- use of electrical supply equipment
- use of refuelling equipment
- use of passenger stations
- use of freight terminals
- use of train formation yards
- use of train formation equipment
- use of depot sidings
- premises and equipment needed for the servicing and maintenance of rolling stock
- use of other technical devices (e.g. sand distributors, water and electrical connections for rolling stock, radiation measurement devices, tank wagon filling gauges, wagon scales, and brake testing equipment), and
- training services for those involved in traffic safety tasks

6 Charges

6.1 Charging Principles and Services Included in the Infrastructure Charge

The legal framework of the basic infrastructure charge is described in the Railway Act (555/2006), Railway Infrastructure Tax (605/2003) and the Ministry of Transport and Communications Decree on the basic infrastructure charge (756/2006).

The basic infrastructure charge covers the minimum access package (the minimum access package is described under 5.2.), including track access to service facilities on the state-owned rail network.

6.2 Infrastructure Charge System

The infrastructure charge system will be changed. The basic principle remains that RHK shall collect a basic infrastructure charge from railway operators on a fair and non-discriminatory basis for the minimum access package and track access to service facilities, calculated on the actual level of use. The basic infrastructure charge shall always be based on the costs directly caused by the operation of railway traffic. The infrastructure tax consists of a charge for external costs and a supplementary charge in accordance with the Capacity and Infrastructure Charge Directive. In the charge for external costs, the environmental effects caused by the operation of rail traffic can be taken into account. The supplementary charge can be collected for covering the full amount of the costs caused by the use of the infrastructure. Furthermore, investment tax will be collected for the Kerava-Lahti line section until 31 August 2021 in order to cover the long-term expenses of the investment.

6.3 Tariffs

The infrastructure charge consists of the charges mentioned in Table 2.

Table 2. Infrastructure charge.

Basic charge	Freight traffic 0.1227 cent/ gross tonne-kilometre Passenger traffic 0.1189 cent/ gross tonne-kilometre
Infrastructure tax	Freight traffic <ul style="list-style-type: none">■ electric 0.05 cent/ gross tonne-kilometre■ diesel 0.1 cent/ gross tonne-kilometre Passenger traffic 0.01 cent/ gross tonne-kilometre
Investment tax (for line section Kerava-Lahti)	Freight traffic 0.5 cent/ gross tonne-kilometre Passenger traffic 0.5 cent/ gross tonne-kilometre

6.4 Performance scheme

Finland is not using an extensive performance scheme. All compensation for the rail network availability and possible breaks will be agreed in the rail network access contract.

6.5 Changes to Charges

Infrastructure charge system is about to change. The principles of the valid infrastructure charge system and the amount of infrastructure charge are published on RHK website.

6.6 Billing Arrangements

RHK invoices the infrastructure charge each calendar month based on the realised performances of the previous month. For invoicing, railway operators shall provide the RHK contact person with information each month on the rail services operated by them to:

**Finnish Rail Administration
Administration Department/
Financial Administration Unit
PO. Box 185
FI-00101 Helsinki
FINLAND**

RHK does not require any guarantee for the payment of infrastructure charges. The infrastructure charge and other charges connected with it are, however, subject to distraint without sentence or decision.

Infrastructure Register

Markings:

On	"yes"
—	"no"
AC2	electrification voltage 25 kV / 50 Hz
ATP-VR/RHK	Automatic train protection

Chart columns:

- **Traffic operating points** (Node of the network) indicates all traffic operating points where the route of the train can be changed.
- **Length of line** is the distance between traffic operating points (Nodes of the network).
- **Max gradient** is the maximum gradient measured in a distance of 1,200 m.
- **Electrification system** indicates that the section of line is electrified.
- **Section blocking or radio-controlled section** indicates that an automatic safety device system is in use in order to protect the railway traffic.
- **ATP** indicates that the section of line is equipped with pan-European safety device system and GSM-R radio network.
- **ERTMS** indicates that the section of line is equipped with pan-European safety device system and GSM-R radio network.
- **ATP coding** for tilting trains indicates the sections on which ATP allows higher speeds for tilting trains.
- **Radio system** indicates whether the type of communication equipment in use between the driver and traffic control is analogue (linjaradio) or digital (GSM-R).

Appendix 2

Rail Traffic Operating Point Register

Legend

() in columns regarding platforms	platform not maintained by RHK
K	yes
Y	yes, private
K in columns regarding traffic control	remote control
M in columns regarding traffic control	manual

Chart Columns:

- **Name** refers the official name of the station and is used in traffic safety work.
- **Another name** is the name of a traffic operating point in Finland's second official language. Another name is usually a Swedish name and only in Sköldvik is the Finnish name Kilpilahti used as another name, contrary to what the present language situation in the municipality would imply.
- **Km Hki** describes the distance of a traffic operating point to the old station hall of Helsinki (already torn down), measured by a track kilometre system. According to the system, the location of all elements on tracks is fixed to landmarks.
- **Municipality** refers to the municipality in which the traffic operating point is located.
- **Traffic control** describes, whether the traffic operating point has the technical equipment to control the train traffic manually or remote. It does not mean that traffic control services are regularly provided.
- **Private sidings** indicates that the traffic operating point has at least one connection to a siding, owned or managed by a private owner (includes everyone except RHK).
- **Shunting** indicates that the form of the tracks at a traffic operating point is such that it is possible to move at least a locomotive to the other end of a line of rolling stock without having to go through the main line of the traffic operating point.
- **Minimum and maximum platform length** indicates the minimum and maximum length of platforms used by passenger trains at the traffic operating point. A passenger train should not be longer than the platform at which it stops. If the platform length is in brackets (), the platform is not maintained by RHK and services are operated at the responsibility of the railway undertaking.

- **Platform height** indicates the nominal height of platforms used by passenger trains, calculated from the surface of the rail.
- **Design train length** indicates the longest track of a traffic operating point, other than the main line going through it. The length is measured in such a way that it is usable in both directions.
- **Power supply** indicates at which traffic operating point it is possible to get 400 V or 1500 V electric current mainly for rolling stock or track machinery power supply purposes.
- **Side loading platform** indicates which at which traffic operating point it is possible load freight cars from the side, and shows the maximum platform length at the traffic operating point.
- **End loading platform** indicates at which traffic operating point it is possible load freight rolling stock from the end of the platform (combined transports).
- **Loading site** indicates at which traffic operating point it is possible to load freight rolling stock at rail level. A typical example is loading of raw timber from a vehicle or an intermediate depot at a rail yard onto flatcars.
- **Crane** indicates at which traffic operating point it is possible to use a crane to load wagons, and states the maximum capacity of the crane. This service is not provided by Finnish Rail Administration (RHK).
- **Fuel** indicates at which traffic operating point there is a fuel distribution point. This service is not provided by Finnish Rail Administration (RHK).
- **Passenger traffic column** shows the operating points where passenger traffic can be operated.
- **Freight traffic transport column** shows the operating points where freight transport can be operated.

Appendix 3

Transport Operation Regulations for Cross-border Movements in Tornio-Haaparanta Area

Introduction

The regulations set forth in Appendix 3 are based on the Train Safety Regulation adopted on 5 June 2005, and its specifications. Some changes will be made to the train safety regulations on 1 November 2008, and therefore this Appendix will be updated in its entirety on the RHK website at <http://www.rhk.fi>.

At the national border the area between signals HP 6/3 and T 832 is called as a "Common zone", which is jointly reserved by the Swedish and Finnish traffic control operators.

In principle, only one train movement is allowed at a time within the common zone, with the exception of irregular situations, such as engine failure or accident.

These regulations have been made in co-operation between Banverket's North Swedish area and the Finish Rail Administration.

Scope

The regulations are applicable to cross-border movements between Tornio and Haaparanta, and within the common zone.

Reference Documents

- **TRI (BVF 900.3)** (Safety Regulation / Traffic Safety Instructions)
- **JT** (Train Safety Regulation)

Definitions

- **Common zone**

The area to be jointly reserved by the Swedish and Finnish traffic control operators and limited on the Swedish side by the 6/3 intermediate signal and on the Finnish side by the T 832 ground signal.

- **Cross-border movement**

Movements entirely or partly operated within the movement common zone.

- **Movement**

Refers to railway work and shunting.

- **Permission**

Refers to permission to allow movement to begin.

- **Swedish movement**

Shunting or railway work started in Sweden.

- **Finnish movement**

Shunting or railway work started in Finland.

General

The regulations are drafted in Swedish and Finnish with an identical content.

No movement is allowed within the common zone without the Swedish and Finnish traffic control operators having reserved the relevant section of line.

More than one movement is allowed in the common zone only in irregular situations, such as engine failure or accident. In such cases, the work of several movements shall be agreed at the time.

Tornio-Haaparanta Cross-border Movements

General

Movements are operated as specified in the Finnish JT, as "shunting" operations, and as specified in the Swedish TRI (BVF 900.3), as "shunting" or "small-wagon shunting" operations.

Messages and message transmission

The Finnish staff shall be in contact with the Finnish traffic control operators, who will deliver message to the Swedish traffic control operators.

The Swedish staff shall be in contact with the Swedish traffic control operators, who will deliver the message to the Finnish traffic control operators.

Haaparanta-Tornio

Prior to the commencement of a Swedish cross-border shunting operation Haaparanta-Tornio direction, permission by the traffic control operators in Haaparanta is required.

Prior to the commencement of a Finnish cross-border shunting operation Haaparanta-Tornio direction, permission by the traffic control operators in Tornio is required.

The traffic control unit that granted a permission shall be notified of the completion of the movement.

Tornio-Haaparanta

Prior to the commencement of a Finnish cross-border shunting operation Tornio-Haaparanta direction, permission by the traffic control operators in Tornio is required.

Prior to the commencement of a Swedish cross-border shunting operation Tornio-Haaparanta direction, permission by the traffic control operators in Haaparanta is required.

The traffic control unit that granted permission shall be notified of the completion of the movement.

Railway Work within the Common Zone

General

The Finnish staff shall be in contact with the Finnish traffic control operators transmitting possible messages to and from the Swedish traffic control operators.

The Swedish staff shall be in contact with the Swedish traffic control operators transmitting possible messages to and from the Finnish traffic control operators.

Swedish staff

The permission of the Haaparanta traffic control operators is required for work carried out by the Swedish staff within the common zone.

Prior to the granting permission, the Haaparanta and Tornio traffic control operators shall reserve the common zone.

The Haaparanta traffic control operators shall be notified of the completion of the work.

Finnish staff

The permission of the Tornio traffic control operators is required for work carried out by the Finnish staff within the common zone.

Prior to granting permission, the Tornio and Haaparanta traffic control operators shall reserve common zone.

The Tornio traffic control operators shall be notified of the completion of the work.

Safety Calls and Documentation

Safety calls

The safety calls between the Swedish and Finnish traffic control operators shall be conducted either in Swedish or in Finnish.

There is a word list with translations in Appendix 5, while Appendix 6 includes examples of phrases to be used.

The safety calls shall be repeated.

Train Log

A train log shall be used according to the instructions and regulations of the traffic control.

Reservation of Common Zone

The reservation of the common zone shall be operated jointly by the Swedish and Finnish traffic control operators.

The clearance of the occupancy of the common zone shall be operated jointly by the Swedish and Finnish traffic control operators.

Maximum Permitted Speed

The maximum permitted speeds are specified in the speed signs, which are described in Appendix 2.

Accidents

Any accident or risk of accident shall be reported to traffic control operators.

Manual Signalling

The Swedish shunting staff shall implement manual signalling as specified in BVF 900.3, irrespective of whether the activity takes place on the Swedish or Finnish side of the border.

The Finnish shunting staff shall implement manual signalling as specified in Jt, irrespective of whether the activity takes place on the Finnish or Swedish side of the border.

A "stop" signal shall always be followed, irrespective of whether it is operated in conformity with the Swedish or Finnish regulations.

Appendix 1

Signals and Signal Aspects

The signals are applicable in conformity with the regulations of the country concerned.

Haaparanta-Tornio direction

From Finnish tracks, intermediate signal (main ground signal) 1/6 km 1310.845.

"Stop"

"Proceed"

"Proceed – check clearance"

"Proceed – check turnouts and clearance"

From Swedish tracks, intermediate signal 5/6 km 1310.697

"Stop"

"Proceed – check turnouts and clearance"

Swedish and Finnish tracks, intermediate signal 6/8 km 1311.006

"Stop"

"Proceed"

Common track, Tornio T 832, km 886.8

"Stop"

"Proceed with caution"

Tornio–Haaparanta direction

No optical signals are used in Tornio for movements towards Sweden.

Intermediate signal 6/3, km 1311.012

"Stop"

"Proceed – check
turnouts and clearance"

Appendix 2

Speed Signs

In conformity with JT

Maximum permitted speed
(the example displaying max. 30 km/h)

In conformity with BVF 900.3

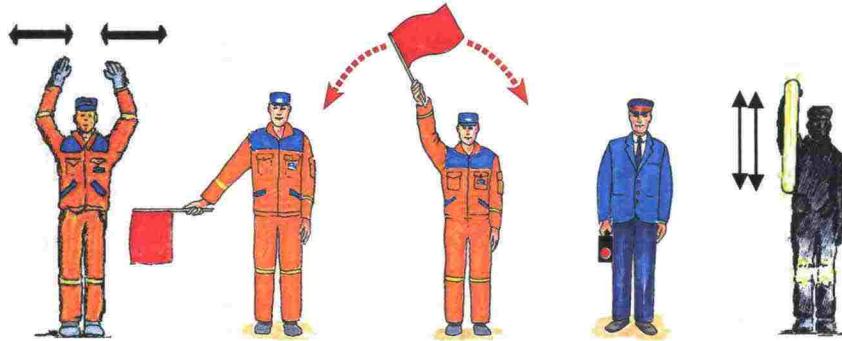

Maximum permitted speed
(the example displaying max. 30 km/h)

Appendix 3

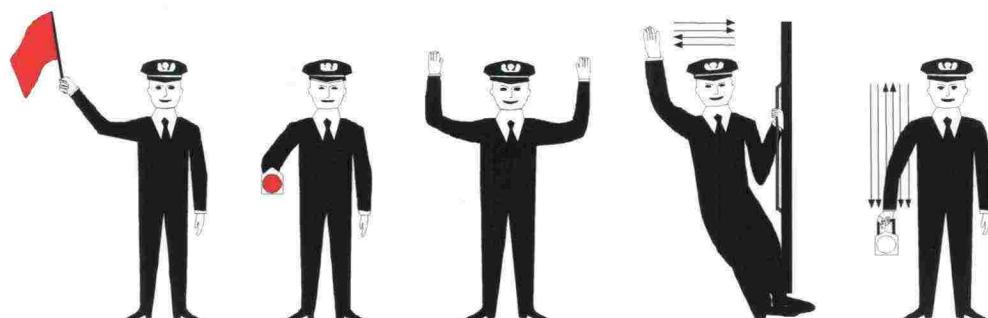

“Stop” Signalling

In conformity with BVF 900.3

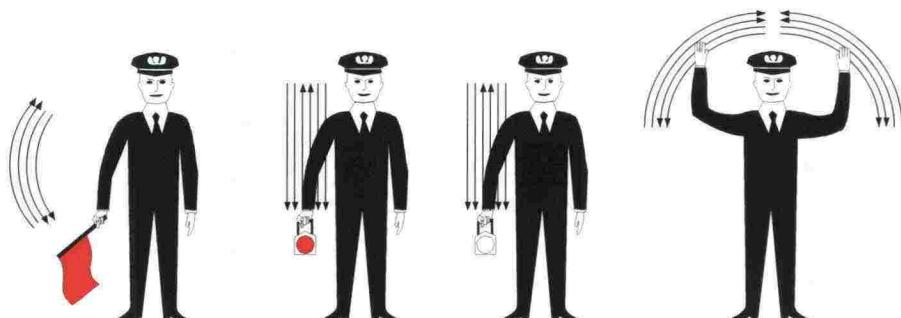

Read: **Stop**

In conformity with Jt

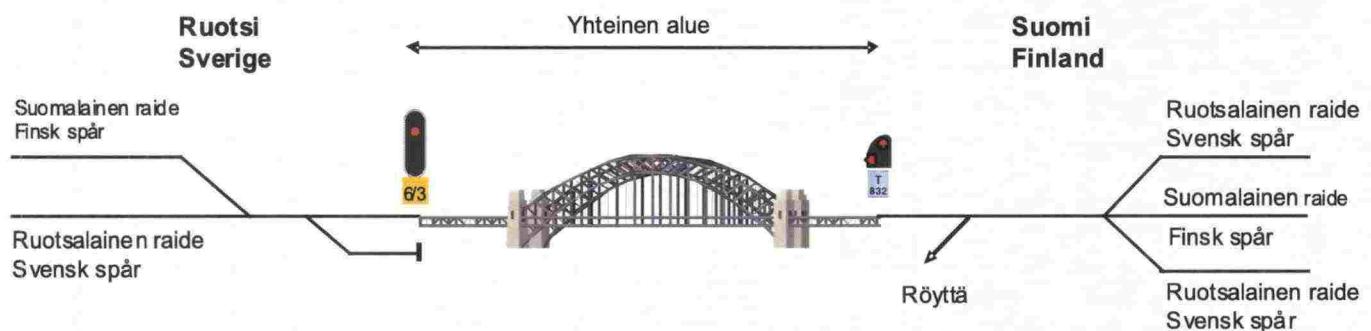

Read: **Stop**

Read: **Danger (emergency stop)**

Appendix 4

Drawing of Haaparanta-Tornio Area

Appendix 5

Translation Table

Should any language problems arise, the below table may be implemented.

Swedish	Finnish	English
Växling	Vaihtotyö	Shunting work
Arbete	Työ	Work
Reserverad zon	Varaus	Reserved / Occupied
Upphävande	Peruuttaminen	Clearance of occupancy
Tägklarerare	Junasuorittaja	Dispatcher
Trafikledning	Liikenteenohjaus	Traffic control
Station	Asema	Station
Fara	Vaara	Danger
Stoppsignal	Seis-opaste	Stop aspect
Passage av en signal	Opastimen ohittaminen	Passing of signal
Signal	Opastin/Opaste	Signal / Signal aspect
Repetera	Toistaa	Repeat
Rätt uppfattat	Oikein ymmärretty	Correctly read

Appendix 6

Example Phrases

Zone reservation request for shunting work

- Swe:** Tägklareraren _____, reserverad zon Haparanda –Torneå, växling.
Fin: Liikenteenohjaus _____, varaus Haaparanta –Tornio välille, vaihtotyö.
Eng: Traffic control _____, reservation Haapanranta –Tornio, shunting.

Zone reservation request for railway work

- Swe:** Tägklareraren _____, reserverad zon Haparanda –Torneå, arbete.
Fin: Liikenteenohjaus _____, varaus välille Haaparanta –Tornio, työ.
Eng: Traffic control _____, reservation Haaparanta –Tornio, work.

Clearence of occupied zone

- Swe:** Tägklareraren _____, upphävande reserverad zon _____ - _____.
Fin: Liikenteenohjaus _____, varauksen peruuttaminen välille _____ - _____.
Eng: Traffic control _____, clearance of occupied zone _____ - _____

Request for reservation in dangerous situation

- Swe:** Tägklareraren _____, Fara Haparanda –Torneå.
Fin: Liikenteenohjaus _____, vaara Haaparanta –Tornio.
Eng: Traffic control _____, danger Haaparanta –Tornio.

Permission to pass stop signal aspect, Haaparanta

- Swe:** Tägklareraren Haparanda, medgivande att passera signal (ett-sex) och/eller (åtta-tre) och/eller (sex-åtta)
Fin: Liikenteenohjaus Haaparanta, lupa ohittaa opastin (yksi-kuusi) ja/tai (kahdeksan-kolme) ja/tai (kuusi-kahdeksan)
Eng: Traffic control Haaparanta, permission to pass signal (one-six) and/or (eight/three) and/or (six-eight).

Permission to pass stop signal aspect, Tornio

- Swe:** Tägklareraren Torneå, växling, medgivande att passera signal (T åtta-tre-två)
Fin: Liikenteenohjaus Tornio, vaihtotyö, lupa ohittaa opastin (T kahdeksan-kolme-kaksi)
Eng: Traffic control Tornio, shunting, permission to pass signal (T eight-three-two).

Correctly read

- Swe:** Rätt uppfattat
Fin: Oikein ymmäretty
Eng: Correctly read.

Repeat

- Swe:** Repetera
Fin: Toista.
Eng: Repeatt

Appendix 4

Loading Gauge

The loading gauge (KU) refers to the space inside which the load on an open wagon shall remain, when the wagon is in the centre position on a straight, even track.

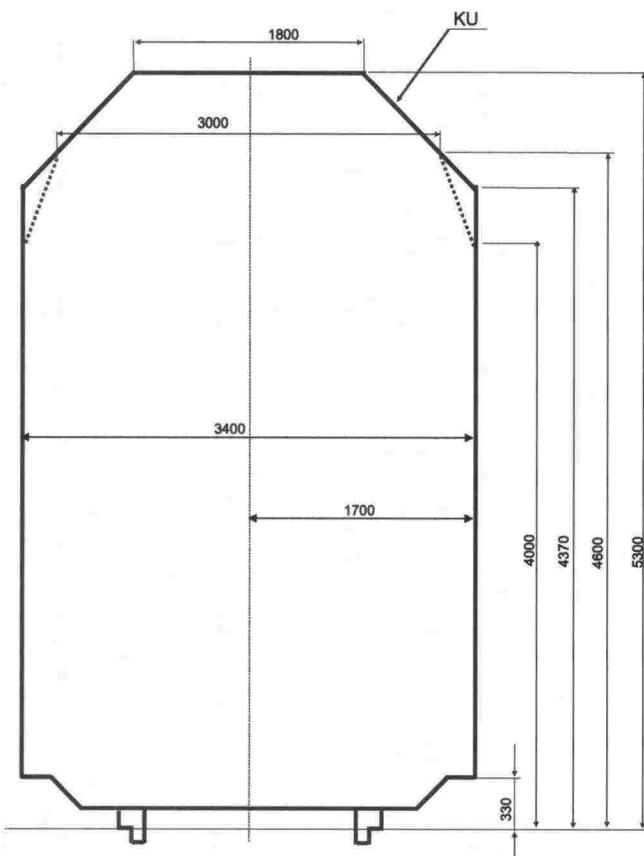

Figure 1. Principal dimensions of the loading gauge.

Use of the Loading Gauge

The loading gauge is valid on the whole rail network with the exceptions mentioned below.

The loading gauge may be used for wagons in which the wheelbase or the distance between bogie centres is max. 17.5 m and the length of the loading area of the wagon outside the wheelbase or the distance between bogie centres max. 0.2 times the length of the wheelbase or the distance between bogie centres. In other cases, loading shall be examined separately.

If there is a risk that the load may be displaced laterally outside the loading gauge during transportation, the width of the load shall be reduced correspondingly. If the displacement of the load may increase the height of some parts of the load so that they extend outside the loading gauge, the height of the load shall be reduced correspondingly.

If the load extends below the floor level of the wagon, the regulations concerning the vehicle gauge (LKU) are applied or the load is carried as a special transport.

Loading Gauge Restrictions

The bridges on the line section Helsinki (passenger railway yard) – Pasila (passenger railway yard) – Ilmala (depot) restrict the loading gauge. The loading gauge valid on these bridges is marked with dashed line (-----) on the loading gauge drawing (Figure 1).

On several industrial and other sidings, there are loading gauge restrictions, which shall be taken into account in local traffic operating.

Transports Exceeding the Loading Gauge

Lorries, lorry trailers and containers exceeding the loading gauge may be transported on separately specified line sections on the conditions laid down in the transport permit. Transports exceeding the loading gauge can be transported on the sections of line mentioned in the network description, according to the conditions based on the Finnish Rail Agency's regulations.

Other transports exceeding the loading gauge are transported as special transports.

Appendix 5

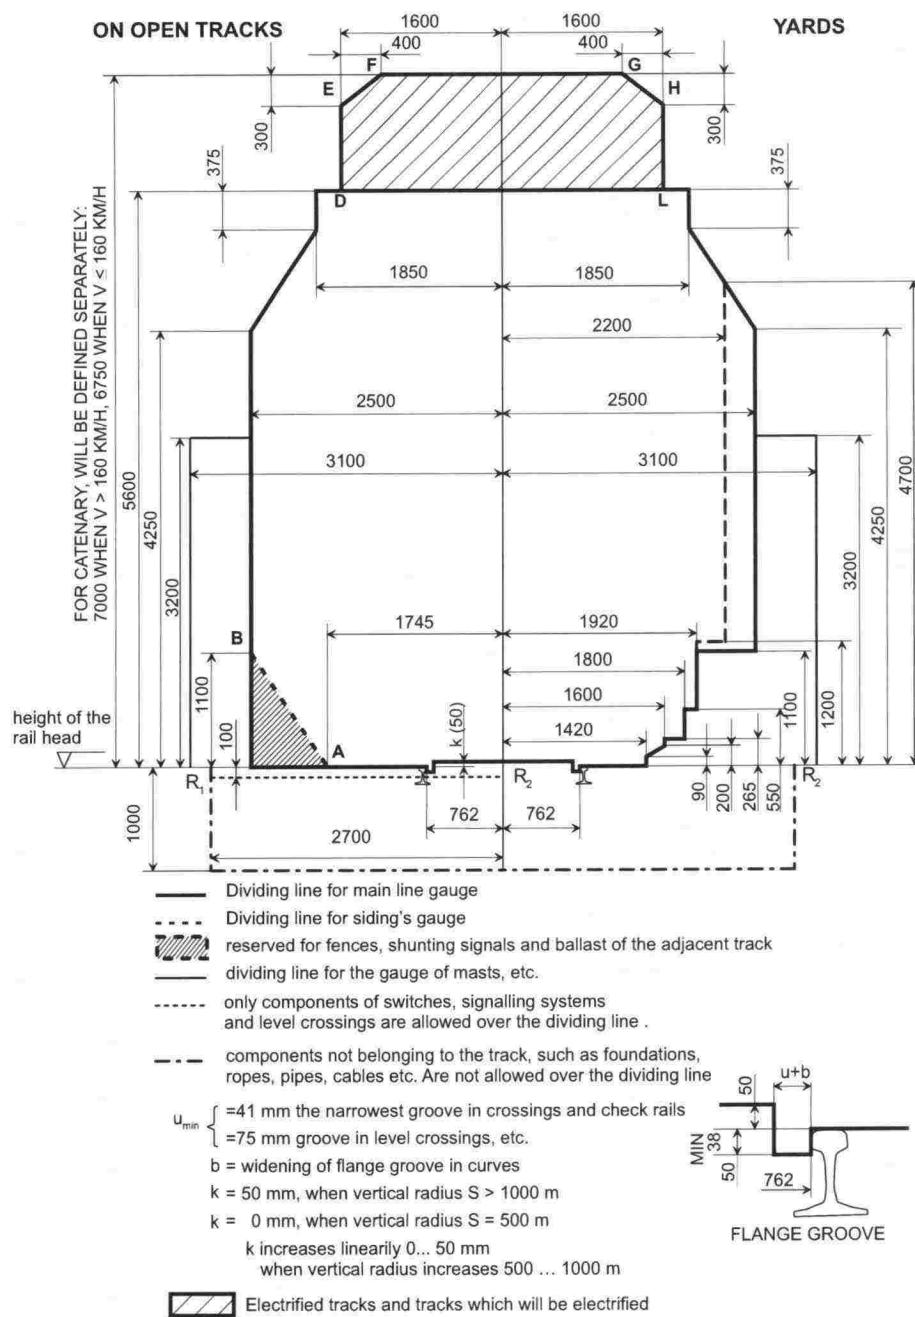

Structure Gauge

The form and dimensions of the structure gauge (ATU) on a straight track, on open line and in the railway yard are shown in Figure 1. The space required for the mounting of the catenary structure and for the passage of the pantograph on electrified lines is marked by the broken line D-E-F-G-H-L. The widths of the structure gauge in curves, restrictions and more detailed instructions are presented in the Rata tekniset ohjeet (RATO) publication, part 2 "Radan geometria" (Track geometry).

Effective Passing Clearance

The structure gauge is used as a guideline for building and mounting new structures and installations in the vicinity of the track. The structure gauge or the deviations from it constitute the so-called effective available structure gauge, i.e. the passing clearance, for special consignments. Information on the passing clearance is collected for each line section and continuously updated by the track maintainers.

Figure 1. Principal dimensions of the structure gauge.

Appendix 6

Superstructure Categories and Permitted Speeds for Different Axle Loads

Division of Lines into Line Categories

The lines are divided into categories according to the superstructure as follows:

Table 1. Division of lines into categories.

Category		Superstructure		
RHK Superstructure Category	Line Category	Rails	Sleepers	Ballast
A	C4	K30, K33	wooden	gravel or equivalent
B ₁	D4	K43, 54 E1, K60, 60 E1	wooden	gravel or equivalent
B ₂	D4	K43, K60	wooden, concrete	railway ballast
C ₁	D4 / E4	54 E1	wooden, concrete before 1987	railway ballast
C ₂	D4 / E4	54 E1	concrete 1987 and after	railway ballast
D	D4 / E4	60 E1	concrete	railway ballast

The border of the category is marked in the middle of the station building in the traffic operating point, unless another point is indicated by the kilometre marking.

The categories for sections of lines are also presented in Figure 1.

The categories may be changed after the Network Statement 2010 has been printed. Possible changes will be updated on the Network Statement 2010 website.

Responsibility of the Track Maintainer

Track maintainer has the right to issue, at their discretion, regulations restricting the permitted axle load and speed depending on the condition of the track superstructure.

Table 2. Superstructure Categories of the main lines and permitted speeds for different axle loads.

Wagons with Axle Loads above the Accepted Limit

- 1) A wagon whose axle load exceeds the maximum axle load permitted for a specific line category is too heavy for the line category in question.
- 2) Wagons shall not be intentionally overloaded. If overload has been detected, the speed of the train must be dropped according to the instructions in the Rail network description and Section 3. If the weight of the load exceeds the permitted load by more than 5% (by more than 2% for 25 t axle load), the excess load shall be unloaded at the first possible station.
- 3) If the maximum permitted axle load of the wagon is 22.5 t, overloaded wagons may be transported only with the following maximum speeds:

Superstructure Category	Max. axle load [t]	Speed [km/h]
A	—	—
B ₁	23.5	35
B ₂	23.5	50
C ₁ , C ₂ , D	23.5	80

Moreover, transportation shall be carried out in accordance with the regulations for special consignments. The condition of the wagons shall be inspected before transportation, especially as concerns the wheelsets.

- 4) On the main lines and sidings belonging to superstructure category A, overloaded wagons, the axle load of which is over 20t but not more than 22.5 t, may temporarily be transported at 20 km/h.

Traffic with over 22.5 t axle loads on the main lines and sidings belonging to superstructure category A is forbidden.

Temporary transportation of overloaded wagons is allowed if occasional need arises. The track maintainer shall be informed of temporary transportation of overloaded wagons to check the condition of the line superstructure.

- 5) Wagons with 24.5t axle load built according to the Russian standard may be carried as special transport on the sections of line laid down separately on the conditions specified in the transport permit. The line sections and conditions for transport are available at the valid Rail Network Description. Traffic on the lines and tracks belonging to superstructure category A is forbidden.

- 6) Wagons with axle loads above the accepted limit, other than those mentioned under (3) and (4), which do not have a permanent traffic permit, are handled as special transport.

Orivesi–Jyväskylä				
Keljonkangas	335+301 – 335+526	140	140	140

Appendix 10

Bridge Restrictions

On the bridges mentioned below, axle loads, speed or both impose restrictions on the running of rail vehicles. The speed restrictions are indicated by speed signs.

Bridges with Weight Restrictions

- 1) Kyrönsalmi bridge on the Parikkala-Savonlinna section of line:
 - Axle load restriction 22.5 t
 - Maximum permitted speed on the bridge is 20 km/h
- 2) Seinäjoki, Kyrönjoki, Nenätönjoki, Kainastonjoki, Teuvanjoki, Närpiönjoki and Kaskistensalmi bridges on the Seinäjoki-Kaskinen section of line.
 - Axle load restriction 22.5 t
 - Maximum speed on the bridges is 60 km/h, unless a lower speed limit is otherwise ordered.

The axle loads mentioned here shall not be exceeded, and the excess load shall be unloaded at the station where it is discovered.

These regulations do not apply to 6- or 8-axle wagons built according to the Russian standard, which can be carried over the above-mentioned bridges only as special transport on the conditions laid down in the transport permit.

Movable Bridges

Table 1. Restrictions related to movable bridges.

Bridge	Railway section	Permitted speed [km/h]
Pohjan silta	Karja–Hanko	50
Kyrönsalmen silta	Savonlinna–Parikkala	20 ¹
Pirttiniemen silta	Pieksämäki–Joensuu	40 ²
Taipaleen kanavan silta	Pieksämäki–Joensuu	30 ²
Pielisjoen silta	Pieksämäki–Joensuu, Joensuu–Nurmes	50
Päävärannan silta	Pieksämäki–Kontiomäki	60
Uimasalmen silta	Joensuu–Nurmes	60
Tahkoluodon silta	Mäntyluoto–Tahkoluoto	50

¹ See Bridges with Weight Restrictions.

² The bridge and the rail joints can be locked, in which case the permitted speed is 60 km/h.

Appendix 11

Significant and Other Track Works Affecting Traffic in 2010

This appendix presents an estimate of those rail maintenance works that will be carried out during the 2010 timetable period and that may affect traffic. The information in the appendices may change once the details of funding and planning become clear. The updated list will be published on the RHK website <http://www.rhk.fi>.

Locations	Affects traffic	Brake description
SOUTHERN FINLAND		
Kirkkonummi-Karjaa: fundamental improvement, weak soil	x	4 x 12h complete breaks
Leppävaara-Kirkkonummi, track work at the station: Tolsa and Jorvas	x	Single track in use and weekend breaks
Hyvinkää-Karjaa: Meltola underpass bridge	x	2 x 16h total breaks
Alteration work in the Ilmala railway yard	-	-
ESKO project	-	-
Heikkaharju-Koivukylä: Ring track, moving the easternmost track, bridge work	x	Easternmost track: 1 x 34h. Eastern middle track: 3 x 34h.
Central Pasila	x	Pasila lower railway yard not in use, passage to old depot from south end until implementation on 1 June 2010. No connection from lower railway yard towards west (to Rantarata, Finnish coastal railway). Passing from lower railway yard to Ilmala not in use. Electrified track connection from south end of the arrival railway yard via Käpylä to Ilmala, except for some breaks, depending on work stages. Töölö car loading and V244 unloading: 12h weekend break
Huopalahti-Vantaankoski: Repairing the waterproofing of bridges	x	Single track in use and traffic breaks
EASTERN FINLAND		
Lahti-Luumäki, lifting the surface and bridge work	x	Single track, between two traffic operating points at once. Sat-Sun 10h total break
Kouvola passenger railway yard	x	Changes in usage of tracks
Luumäki-Imatra: underpass bridges	x	2 x 16h total break
Luumäki-Vainikkala: bridges and weak soil	x	6h work breaks
Mikkeli-Pieksämäki: underpass bridges	x	16h total break
Pieksämäki-Kuopio: tunnel work, underpass bridges, Kuopio mainline points	x	24h total break
Renewal of Kuopio railway yard	-	-
Kuopio-Iisalmi, screening, rail replacement and mainline points replacement	x	8h work breaks
Construction of Kotolahti railway yard, installation of mainline points Track changes in Kivisalmi	x	4 x 10h work breaks
Kouvola-Kuusankoski: replacing the superstructure	x	In summer 10h at night
Parikkala-Joensuu: underpass bridges	x	16–24h total break
Joensuu-Ilomantsi, replacing the superstructure, work between Joensuu and Heinävaara	x	total break 6 week

Locations	Affects traffic	Brake description
WESTERN FINLAND		
Tampere-Orivesi, screening	x	8h single track
Seinäjoki-Oulu, raising the standard, phase I: Seinäjoki-Kokkola, bridge work; Seinäjoki-Ruha, double track jointing work Pännäinen, Kolppi and Kruunupyy, traffic operating point works. New traffic operating point in Riijärvi. Coordination with Tuomioja-Liminka and Kokkola-Ylivieska works.	x	7 x 12h, 1 x 20h and midsummer break 24h
Kokkola-Ylivieska double track, three bridges	x	2 x 12h, Sat-Sun nights and midsummer break 24h
Seinäjoki-Vaasa, electrification	x	January–June: 3h day work break. May–October: 7h night work break
Kokkola railway yard and Yksipihlaja intermediate railway yard	x	Track reservations
Seinäjoki-Kaskinen, replacing the superstructure, bridge renovations	x	In summer 12h at night
Tampere passenger railway yard: Rongankatu underpass	x	Changes on track usage 4 x 36h
Turku-Toijala points, Akaa underpass bridge and supporting walls in Turku	x	8 x 8h, 3 x 12h and 1 x 16h work breaks at weekends
NORTHERN FINLAND		
Seinäjoki-Oulu, raising the standard, phase I: Tuomioja-Liminka, substructure and superstructure, points and railway bridges. New traffic operating points in Ahonpää (between Vihanti and Tuomioja) and Tikkaperä. Coordination with Seinäjoki-Kokkola and Kokkola-Ylivieska works.	x	8h work break June–September, breaks: 8 x 12h, 2 x 20h, midsummer break 24h
Tornio-Kolari, replacing the superstructure	x	Weeks 22–30, five-day total breaks weekly
Kontiomäki-Vartius, replacing the sleepers (about 40,000 sleepers)	x	Weeks 26–38, 10h night work break
OTHER BREAKS		
Replacement of individual points in the following railway yards: Helsinki, Kouvolan, Kotka, Hamina, Vainikkala, Lappeenranta, Joensuu, Pieksämäki, Uimaharju, Tampere, Seinäjoki, Jyväskylä, Turku, Riihimäki, Oulu	x	8–16h work breaks
Maintenance investments, e.g. replacing the superstructure, bridge and drum renovations	x	–
Track check-ups on tracks with speeds over 140km/h	–	–
Pillaring the maintenance tracks and points	x	–
Rail maintenance work to be ordered separately, e.g. replacing single sleepers and worn-out frame angle bars.	x	–

Map of Traffic Planning Areas

Coordination of track work and traffic according to the traffic planning areas shown on the map below.

- Helsinki
- Tampere
- Oulu
- Kouvola
- Pieksämäki
- Joensuu

Appendix 12

Passenger Information at the stations of the State-owned Rail Network

RHK has acquired a new passenger information system (MIKU) that will replace the older information systems. MIKU allows the info staff to control display devices and provide passengers with up-to-date information.

A new Information Centre will also be established in the 2009 timetable period, and it will, among other things, notify the passengers about disturbances and exceptions. More information can be found at <http://www.rhk.fi>.
